# Viewing Results

- Once the simulation has finished running, it is time to display and analyze the collected results
- OPNET/Riverbed provides several utilities for displaying, examining, and comparing the results collected during simulation

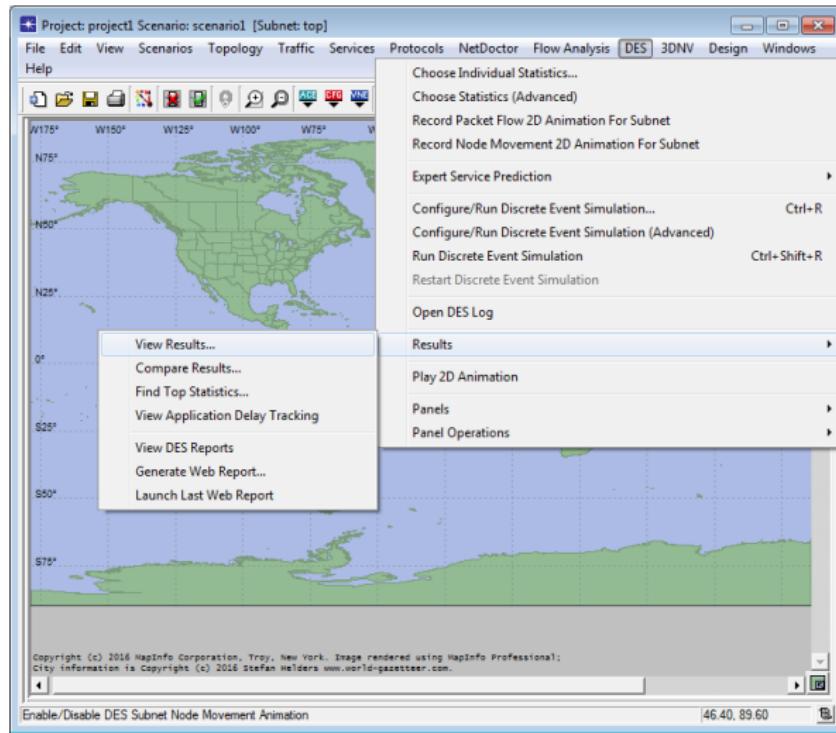

# Viewing Results (cont'd)

- View Results

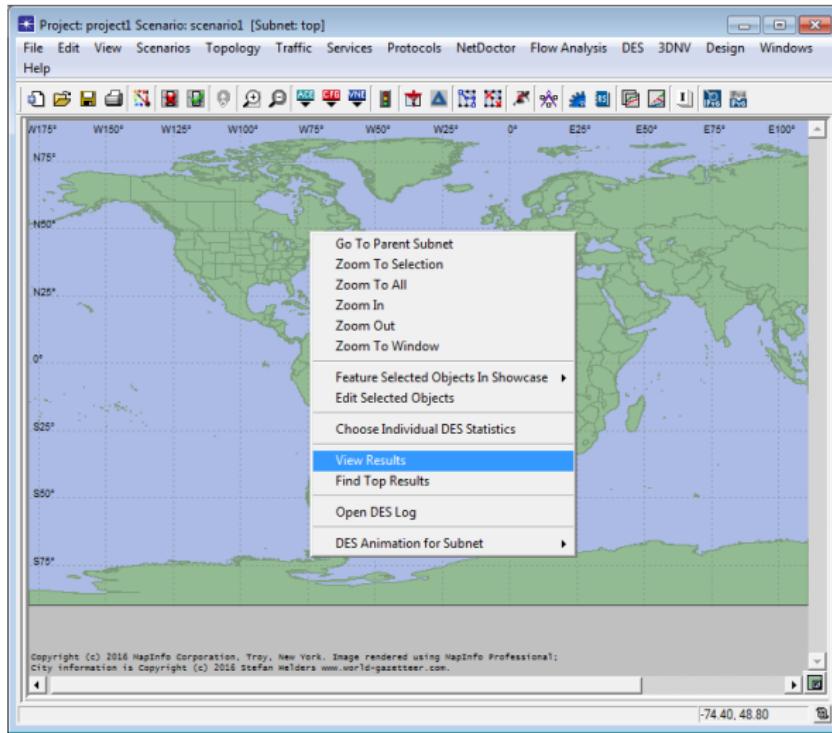

# Viewing Results (cont'd)

- DES  $\Rightarrow$  Results  $\Rightarrow$  View Results...

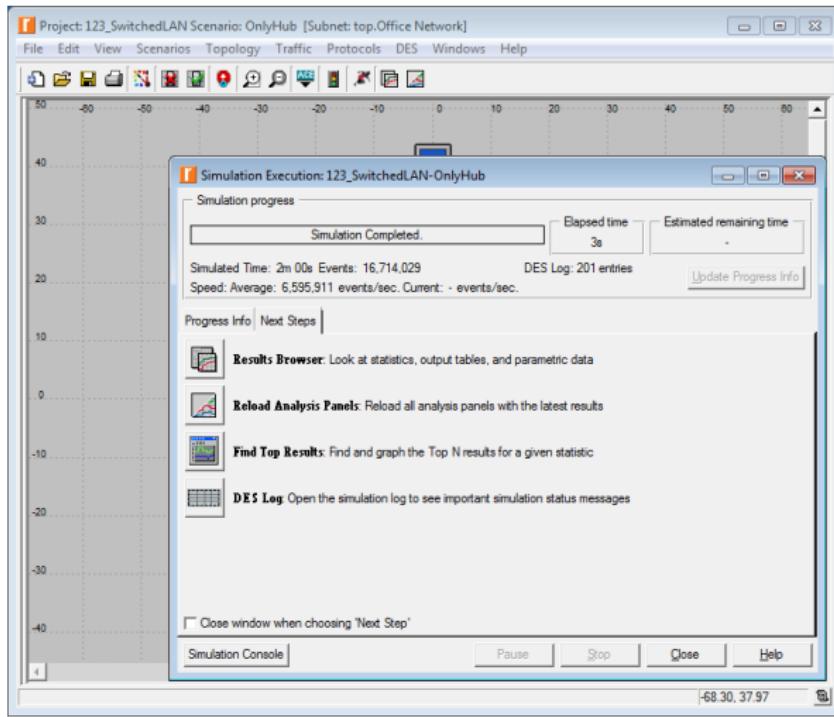

# Viewing Results (cont'd)

- Right-click anywhere within the workspace ⇒ View Results

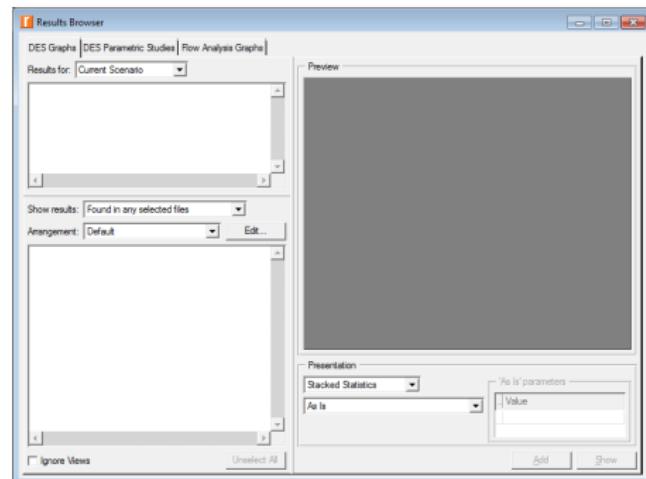

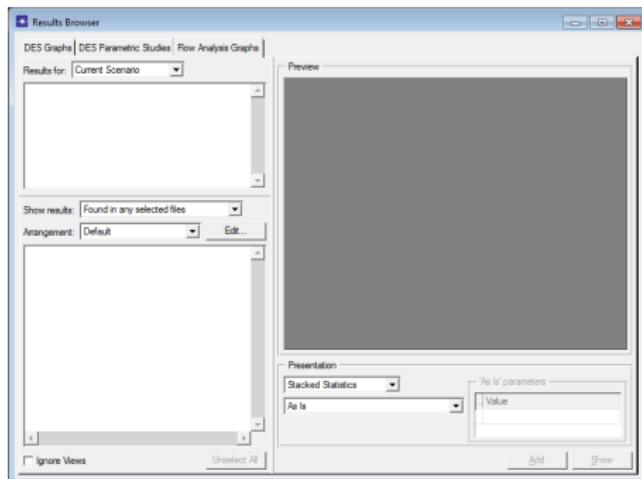

# Viewing Results (cont'd)

- Riverbed Modeler Academic Edition : Results Browser

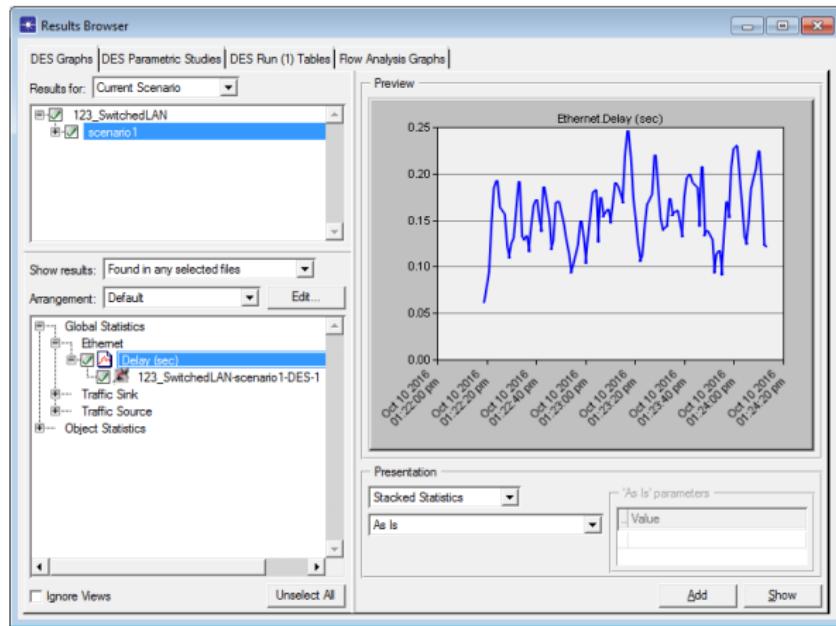

# Viewing Results (cont'd)

- **Results Browser** – displays information in the form of graphs
- **OPNET Modeler vs. Riverbed Modeler Academic Edition**

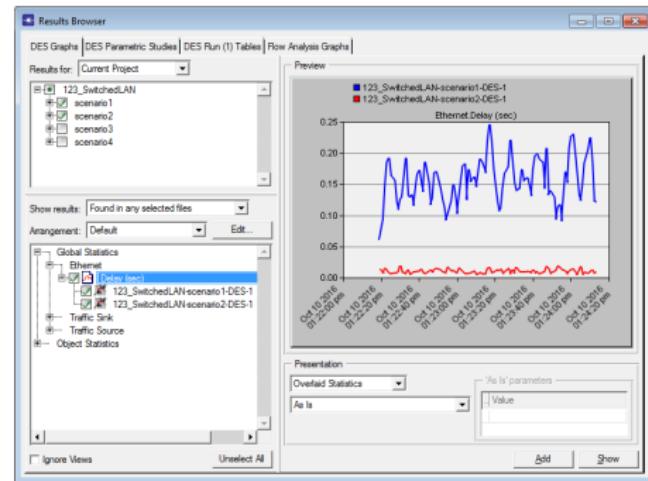

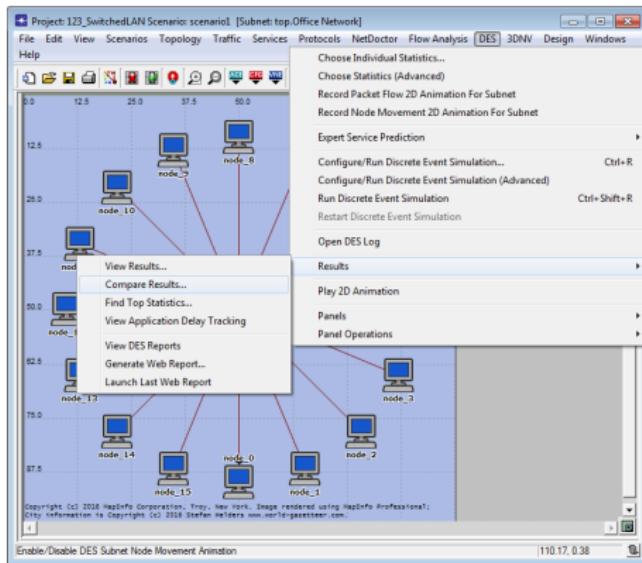

# Viewing Results (cont'd)

- DES  $\Rightarrow$  Results  $\Rightarrow$  View Results...  $\Rightarrow$  **Current Scenario** (default)

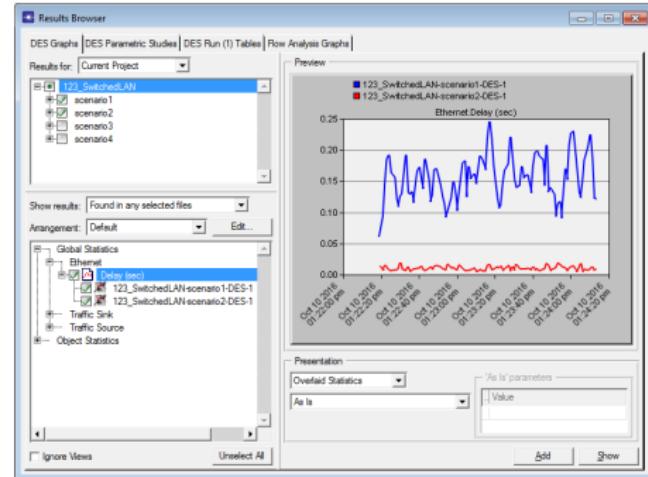

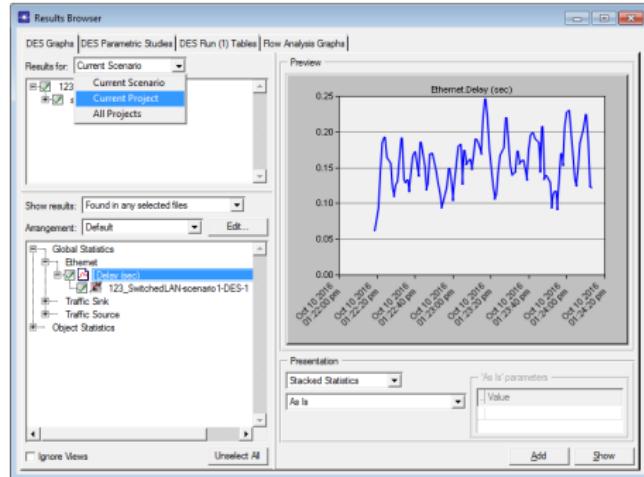

# Viewing Results (cont'd)

- DES ⇒ Results ⇒ Compare Results...

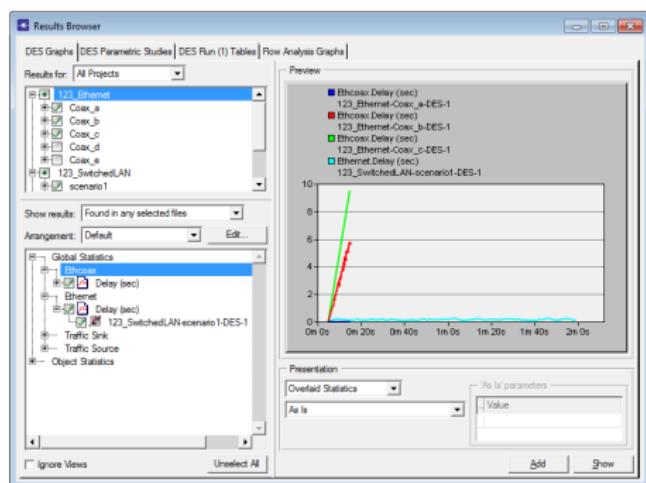

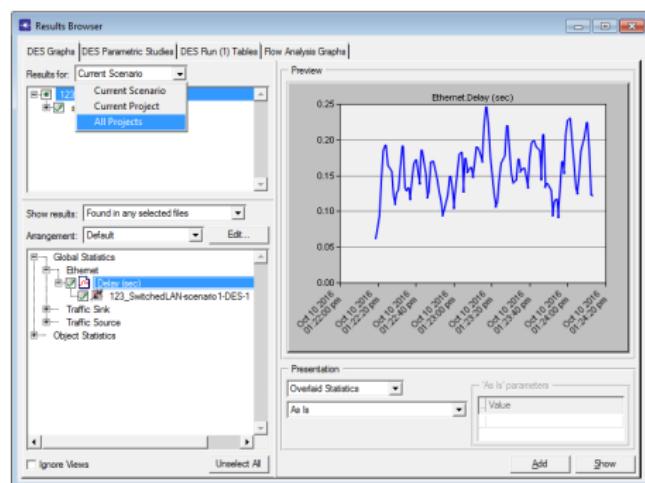

# Viewing Results (cont'd)

- DES  $\Rightarrow$  Results  $\Rightarrow$  View Results...  $\Rightarrow$  Current Project

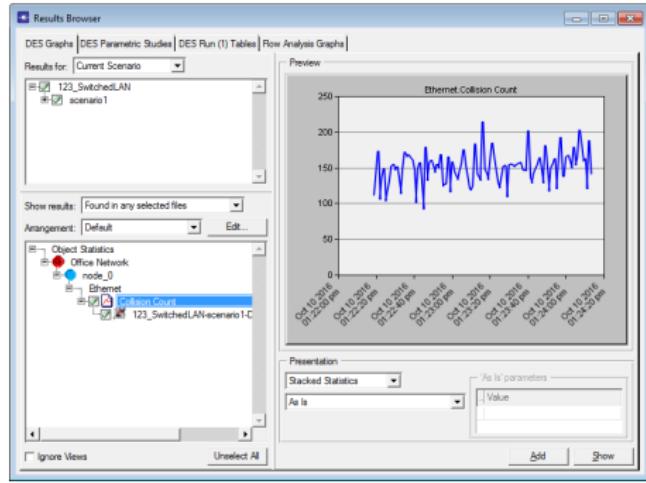

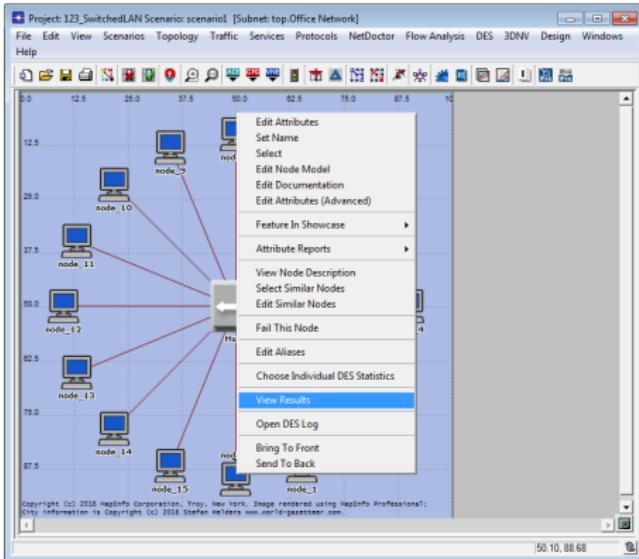

# Viewing Results (cont'd)

- DES ⇒ Results ⇒ View Results... ⇒ All Projects
- Results for – specifies whether the simulation results will be retrieved from Current Scenario, Current Project, or All Projects (op\_models)

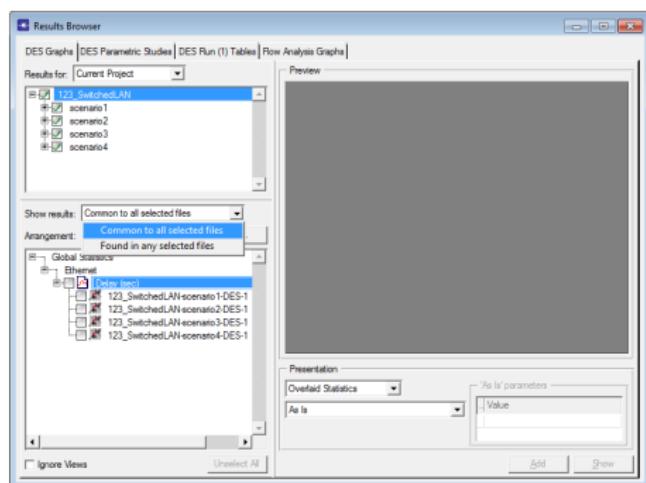

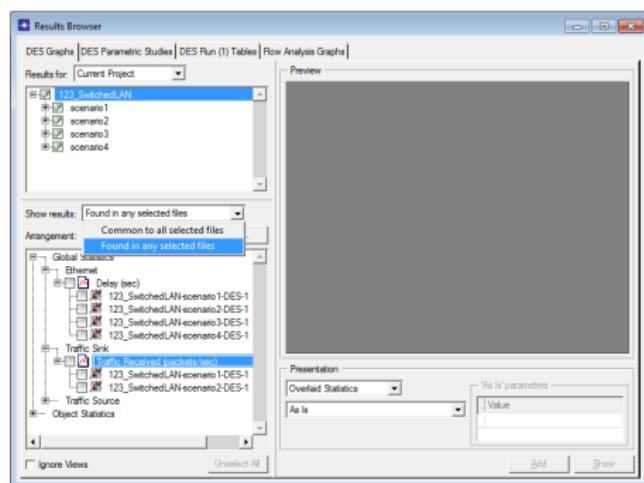

# Viewing Results (cont'd)

- Viewing results for a single object
- Right-click on the object of interest  $\Rightarrow$  View Results

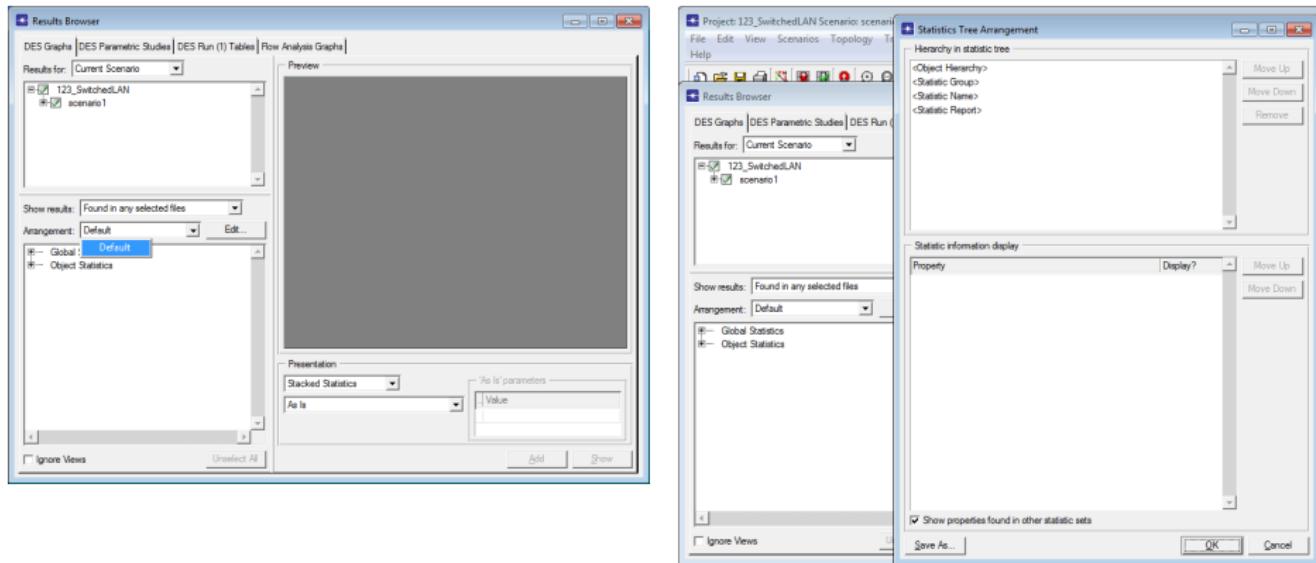

# Viewing Results (cont'd)

- **Show results** – specifies which statistics will be available when multiple scenarios have been selected
- **Found in any selected file** vs. **Common to all selected files**

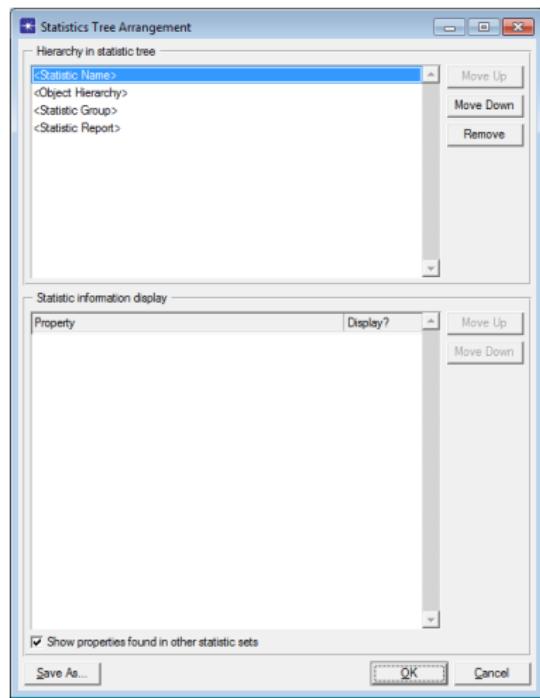

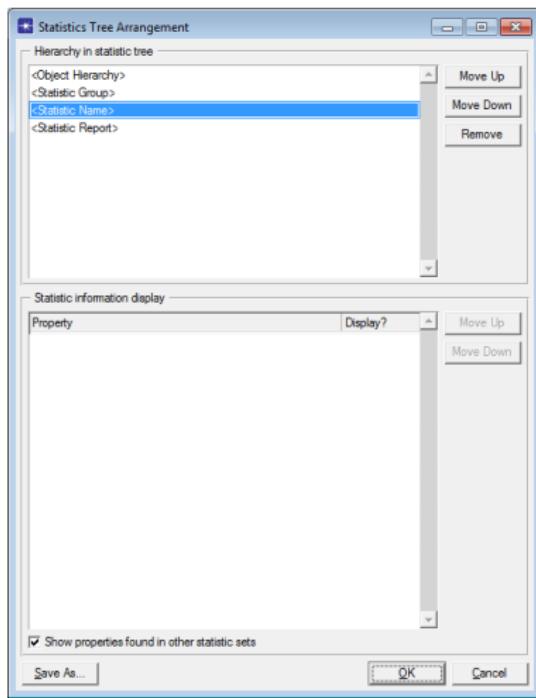

# Viewing Results (cont'd)

- **Arrangement** – allows custom configuration of statistics arrangement

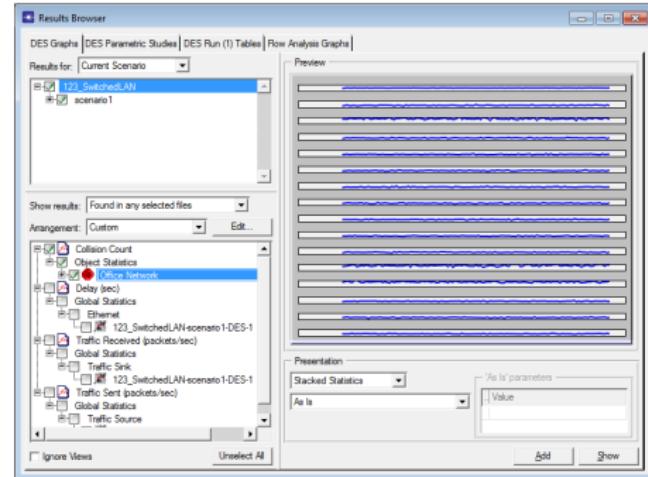

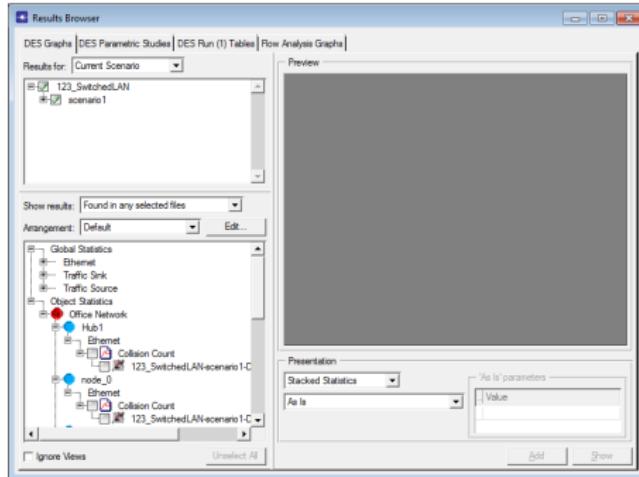

# Viewing Results (cont'd)

- Arrangement: Default vs. Custom

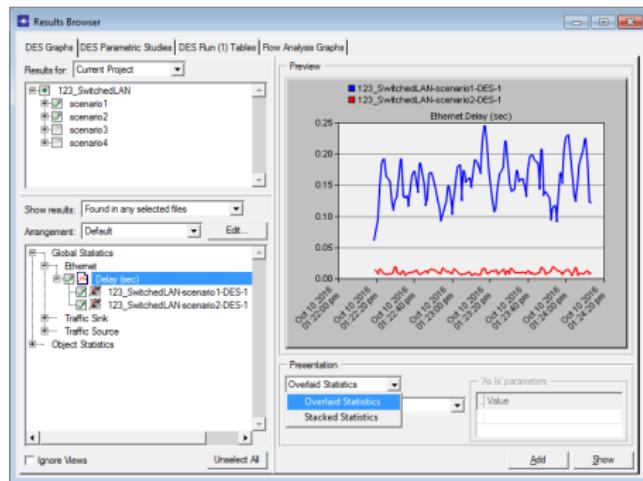

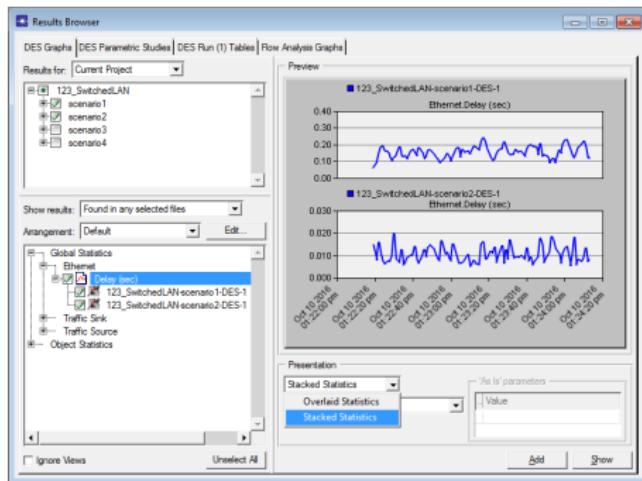

# Viewing Results (cont'd)

- Arrangement: Default vs. Custom

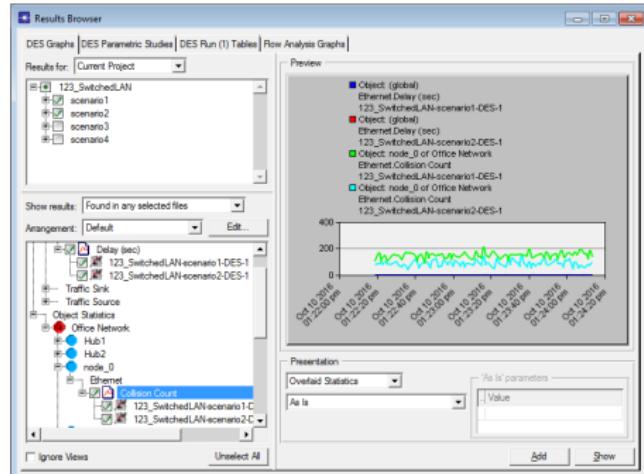

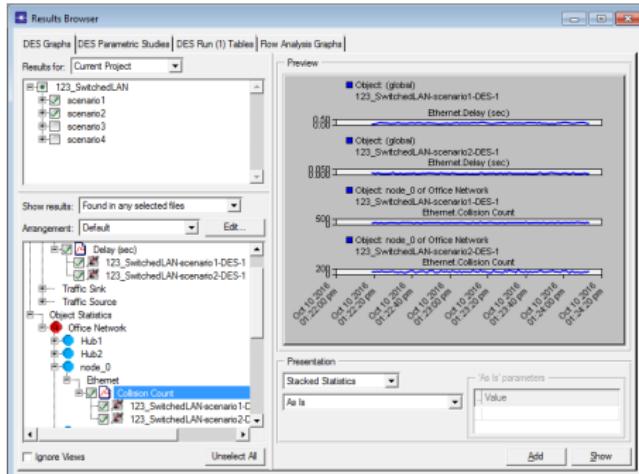

# Viewing Results (cont'd)

- **Presentation** – controls the display of graphs when multiple statistics have been selected
- Presentation: **Stacked Statistics** vs. **Overlaid Statistics**

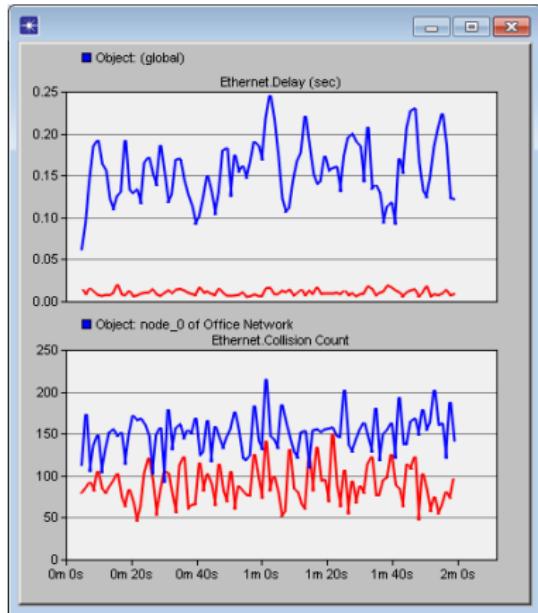

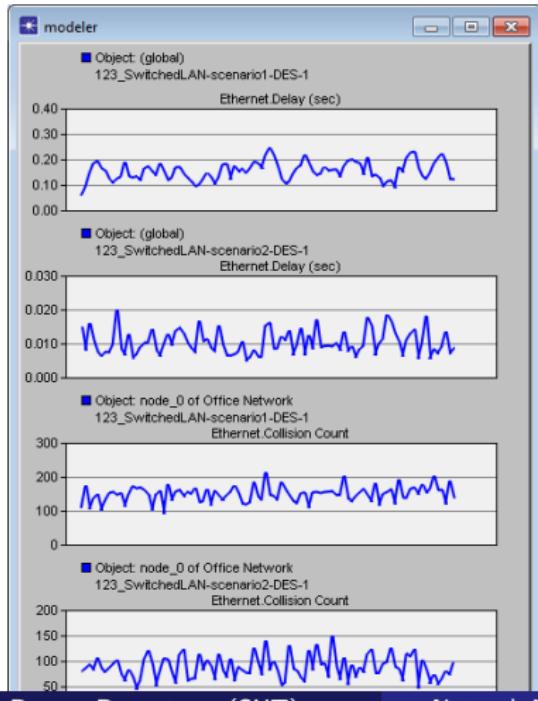

# Viewing Results (cont'd)

- Don't mix different statistics on the same graph! 😞
- E.g., delay + load + retransmissions + ...

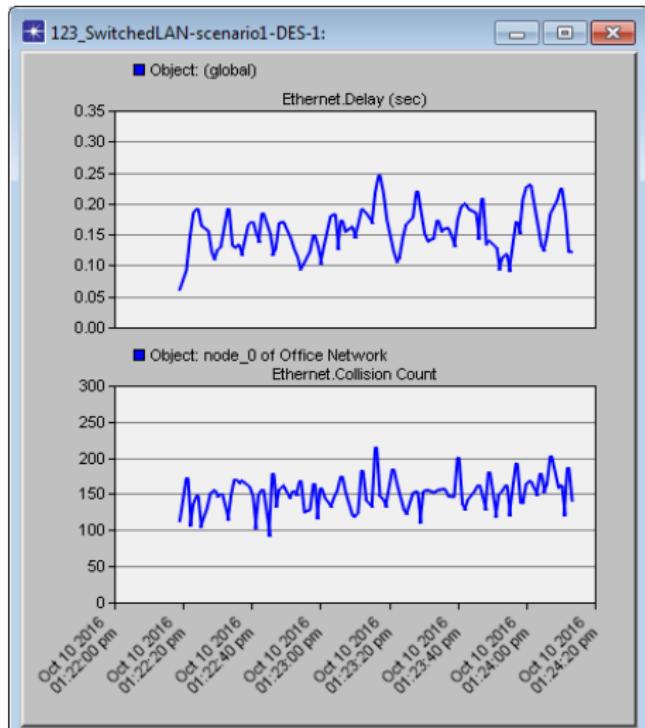

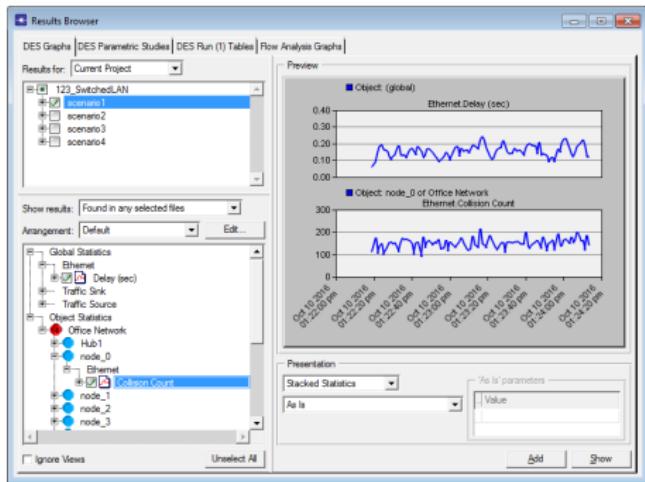

# Viewing Results (cont'd)

- This is how it should be done
  - E.g., 2 scenarios, Delay (seconds) + Collision Count (node\_0)

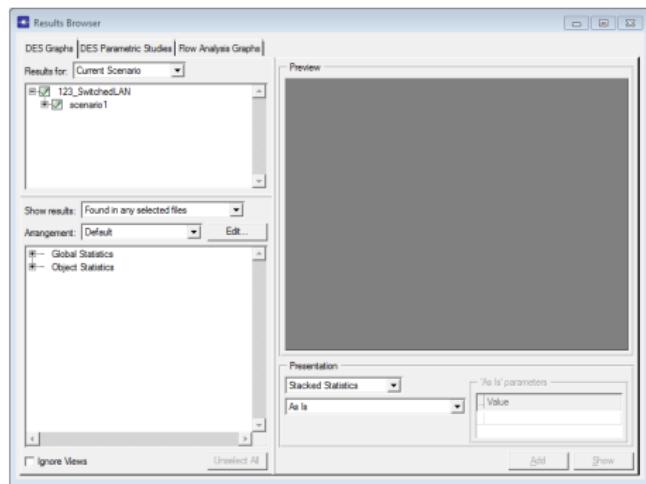

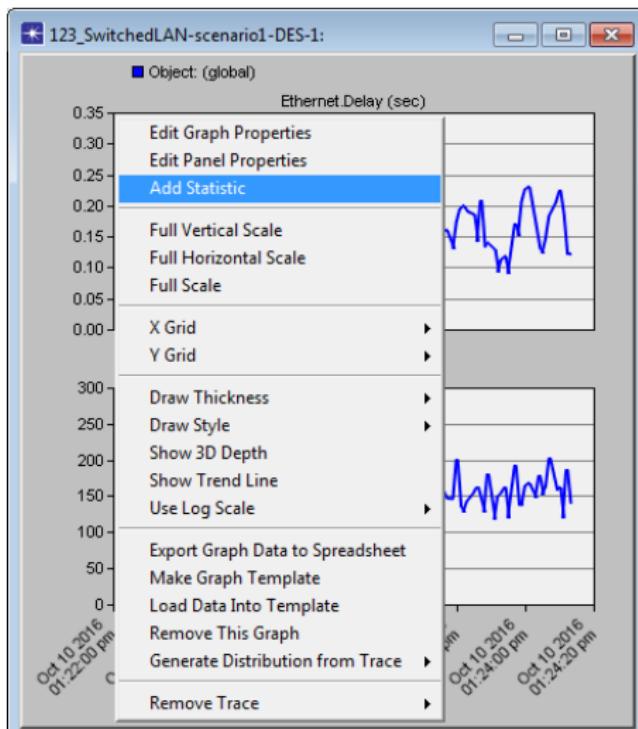

# Viewing Results (cont'd)

- Adding graphs: Delay (seconds) vs. Collision Count (node\_0)

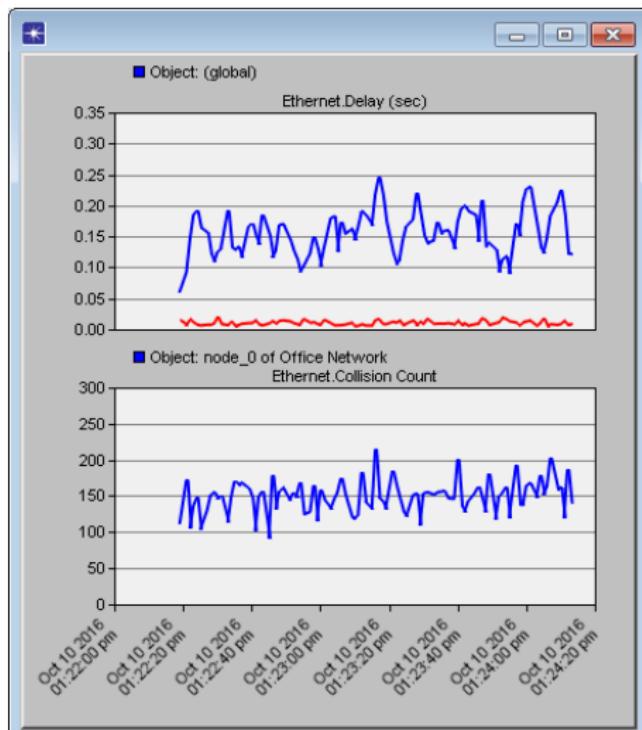

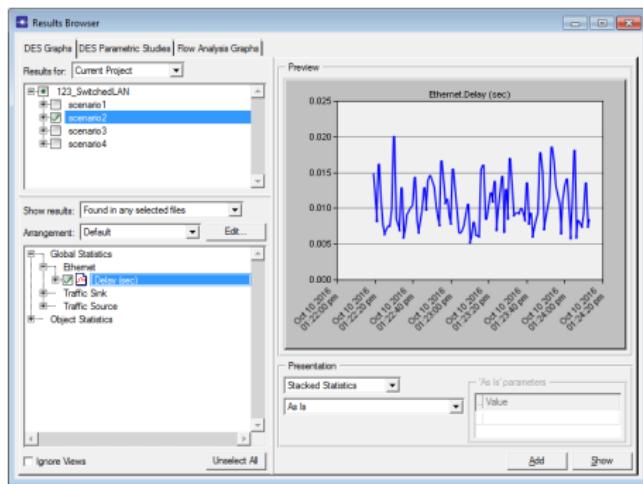

# Viewing Results (cont'd)

- Adding graphs: Delay (seconds) vs. Collision Count (node\_0)

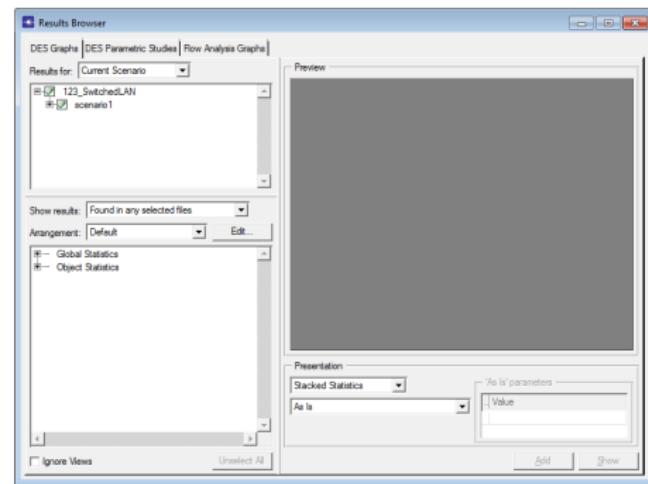

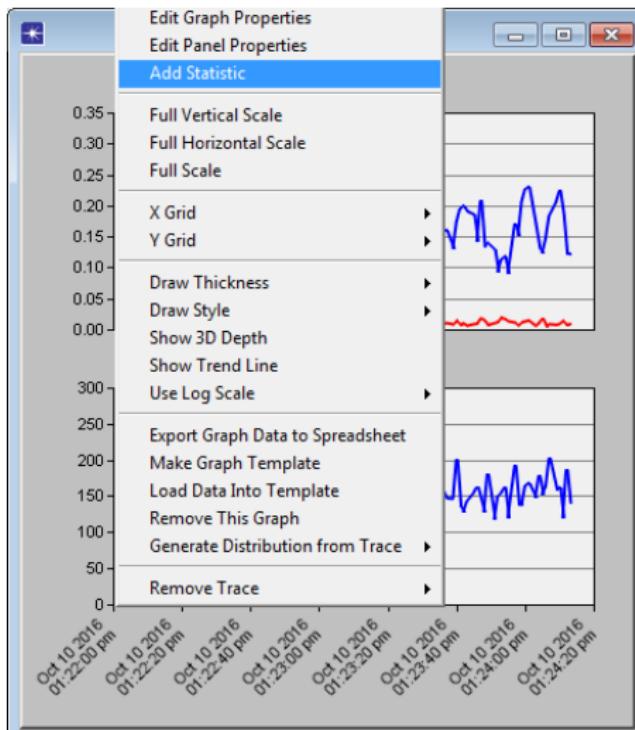

# Viewing Results (cont'd)

- Adding graphs: Delay (seconds) vs. Collision Count (node\_0)

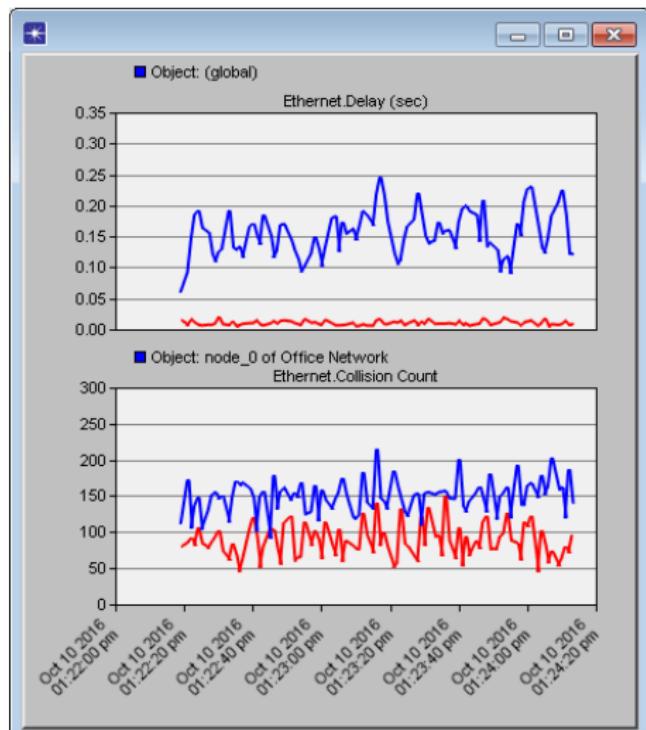

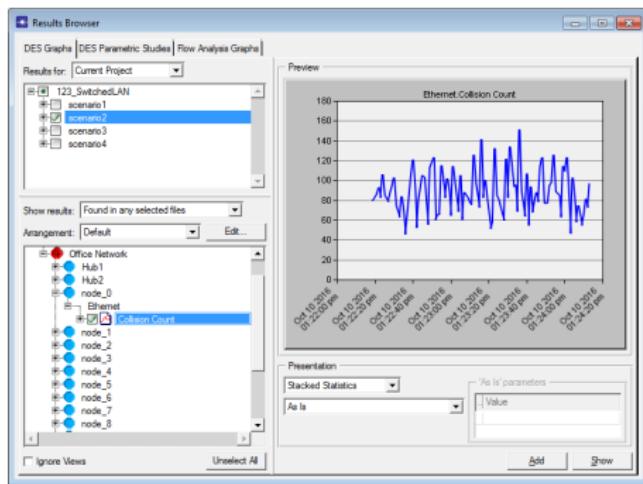

# Viewing Results (cont'd)

- Adding graphs: Delay (seconds) vs. Collision Count (node\_0)

# Viewing Results (cont'd)

- Adding graphs: Delay (seconds) vs. Collision Count (node\_0)

# Outline

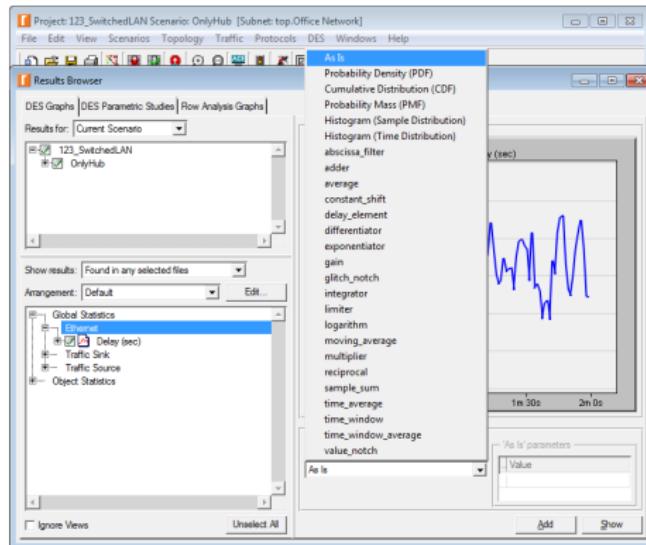

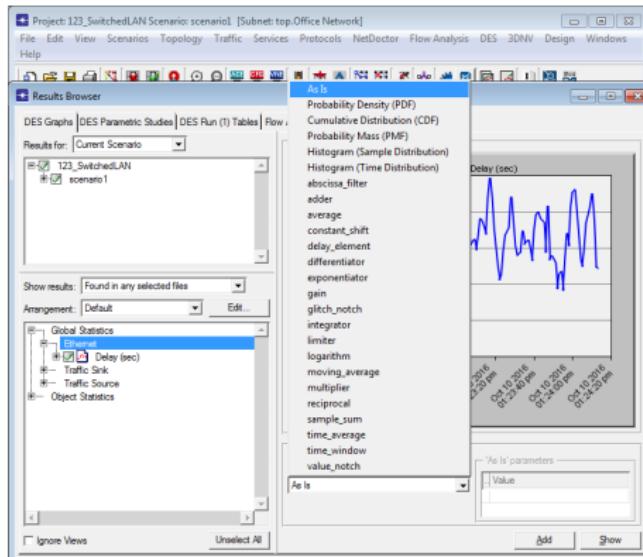

## 1 Viewing results

## 2 Predefined filters

- As Is
- Probability Density (PDF)
- Probability Mass (PMF)
- Cumulative Distribution (CDF)
- Histogram (Sample Distribution)
- Histogram (Time Distribution)
- abscissa\_filter
- adder
- average
- constant\_shift
- delay\_element
- differentiator
- exponentiator
- gain
- glitch\_notch
- integrator
- limiter
- logarithm
- moving\_average
- multiplier
- reciprocal
- sample\_sum
- time\_average
- time\_window
- time\_window\_average
- value\_notch

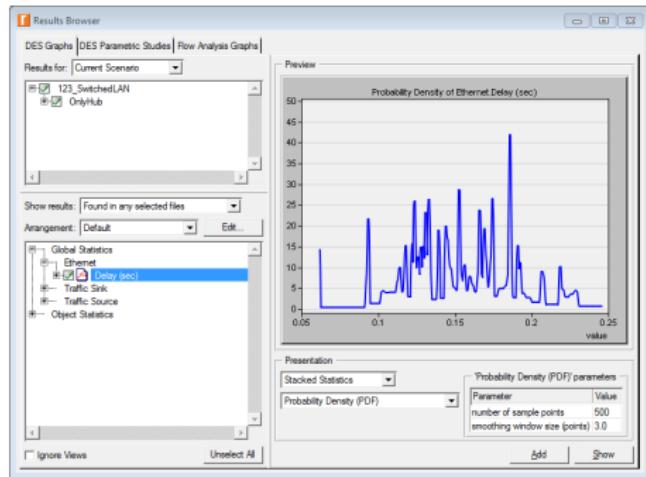

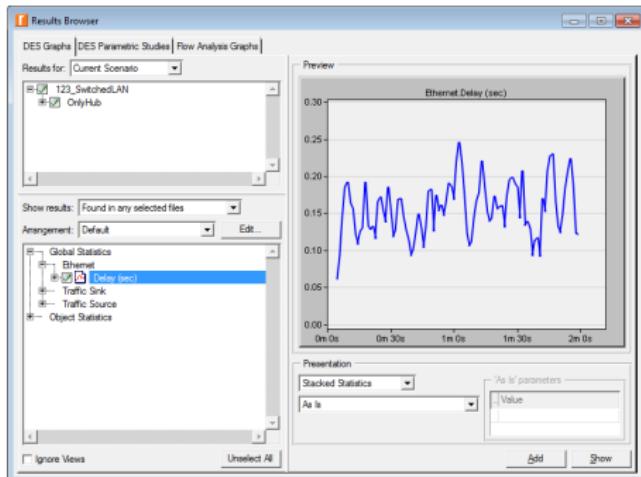

# Predefined Filters

- **Predefined filters** – a set of operations that can be used to transform collected data to generate new statistics

# Predefined Filters (cont'd)

- **Probability Density Function (PDF)** – corresponds to the likelihood that the input statistic's value lies within a specific range
  - $Pr(a \leq X \leq b) = \int_a^b f(x)dx$ , where  $X$  is a **continuous(!)** RV

## Predefined Filters (cont'd)

$$\bullet dx = \frac{\text{max value} - \text{min value}}{\text{number of sample points}} = \frac{0.246304161 - 0.061510018}{500} \approx 0.00037 \text{ seconds}$$

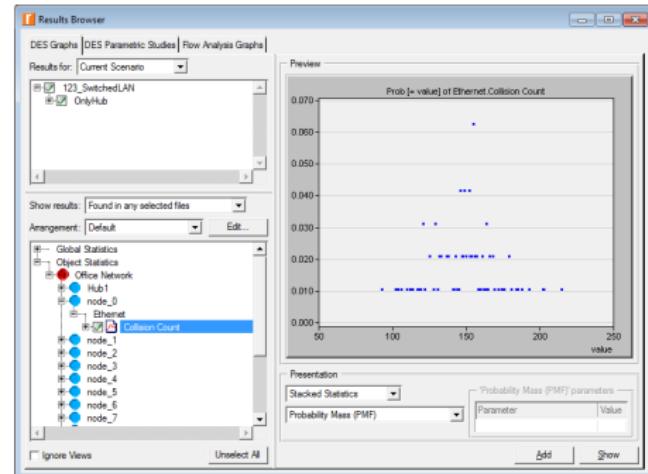

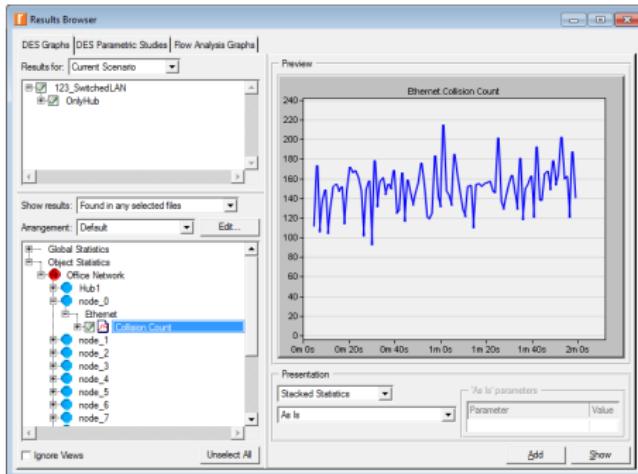

- Unlike a probability, a PDF can take on values greater than 1
- But its integral over the entire space is equal to 1

| A  | B        | C   | D | E | F | G | H | I | J |
|----|----------|---|---|---|---|---|---|---|---|

## Predefined Filters (cont'd)

- **Probability Mass Function (PMF)** – corresponds to the likelihood that the input statistic's value is exactly equal to  $x$ 
  - $Pr(X = x)$ , where  $X$  is a **discrete(!)** RV

## Predefined Filters (cont'd)

- $Pr(\text{Collision Count} = 155) = \frac{6}{\text{values per statistic} - \#N/A} = 0.0625$ 
  - Any event in the distribution has a probability between 0 and 1
  - The sum of all probabilities is 1

A screenshot of Microsoft Excel showing a table of collision counts. The table has columns A and B. Column A contains row numbers from 1 to 15. Column B contains values ranging from 0.010417 to 0.020833. Row 15 is highlighted in yellow. The formula bar shows "value". The status bar at the bottom indicates "READY".

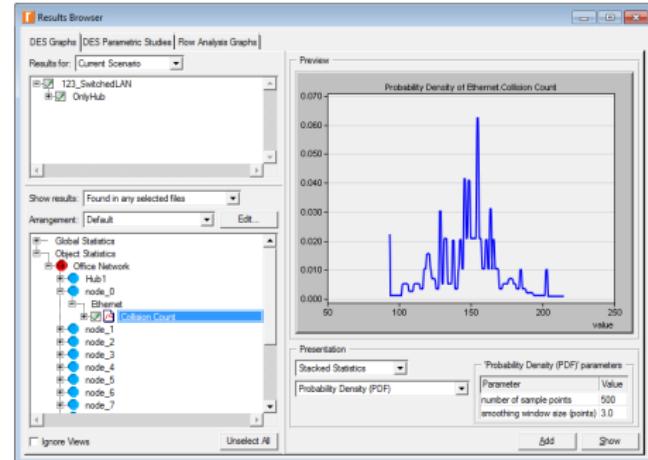

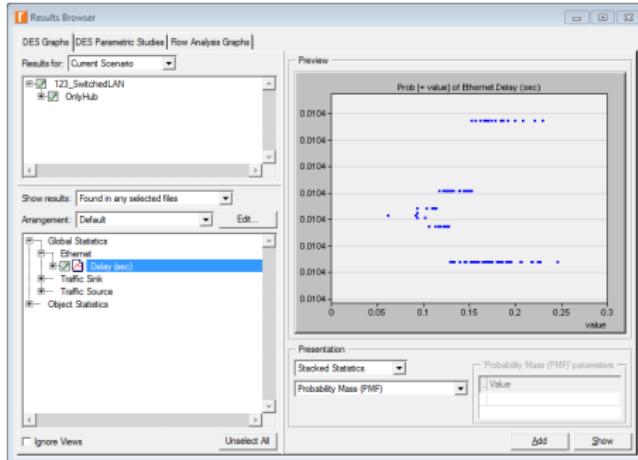

|    | A     | B   | C | D | E | F | G | H | I | J |
|----|-------|---|---|---|---|---|---|---|---|---|

# Predefined Filters (cont'd)

- Remember: PDF for continuous and PMF for discrete RVs!

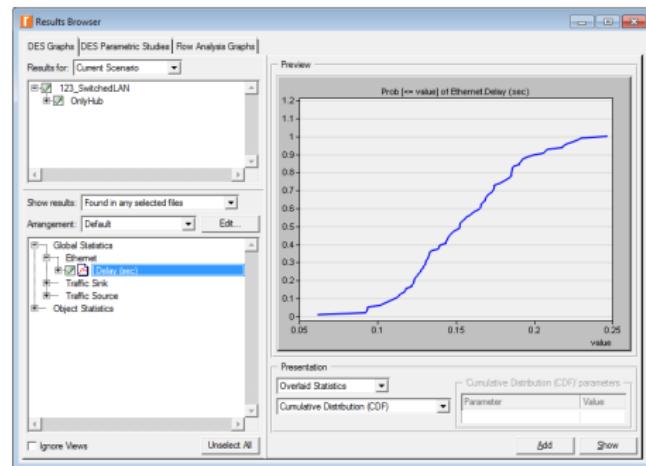

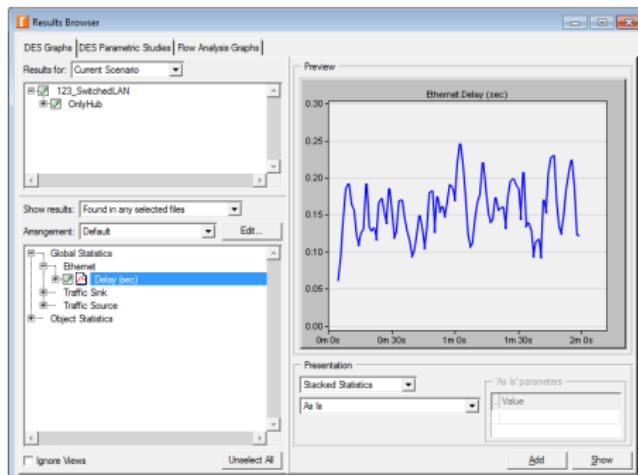

## Predefined Filters (cont'd)

- **Cumulative Distribution Function (CDF)** – corresponds to the likelihood that the input statistic's value is less than or equal to  $x$ 
  - $Pr(X \leq x)$ , where  $X$  is a RV of **any(!)** kind

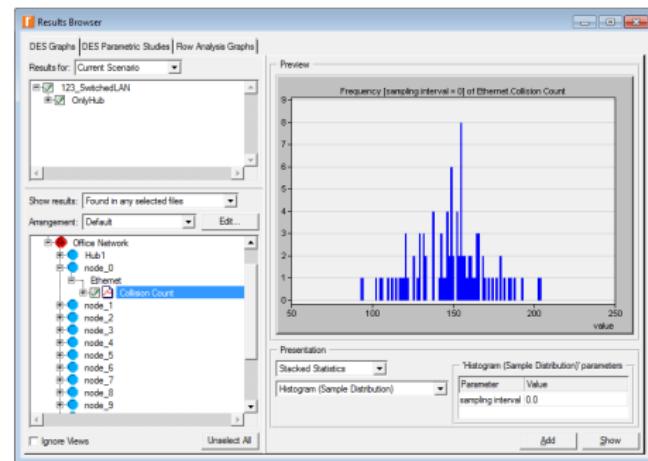

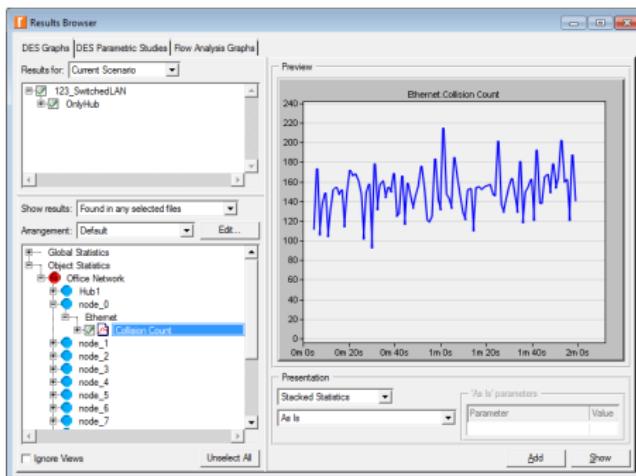

# Predefined Filters (cont'd)

- In many cases, system performance requirements are stated as '**the probability of receiving a packet with delay larger than ... ms must be no greater than ... %**' and so on
  - CDF allows compliance with such a requirement to be readily determined by finding the threshold value on the horizontal axis and the corresponding probability on the vertical axis

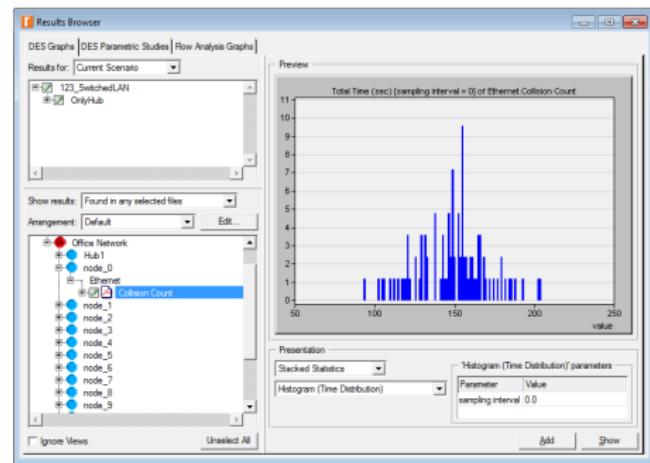

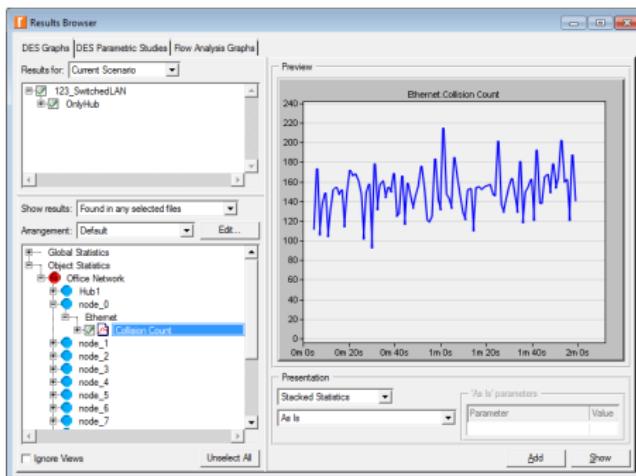

## Predefined Filters (cont'd)

- **Histogram (Sample Distribution)** – uses the number of entries falling within each interval as the measure of frequency
  - If sample interval = 0.0, then there will be 100 intervals
  - If sample interval = ..., then it sets the interval size

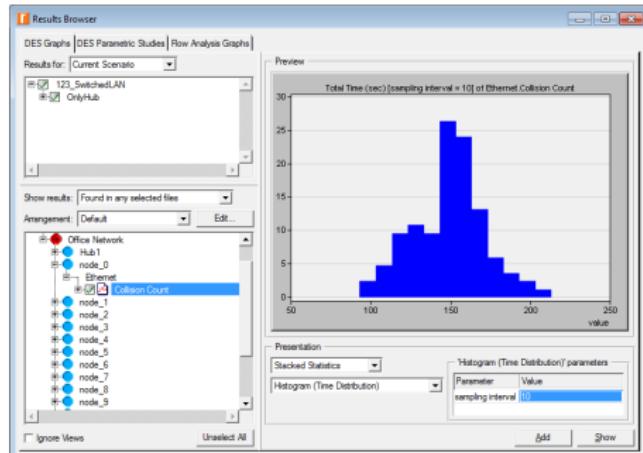

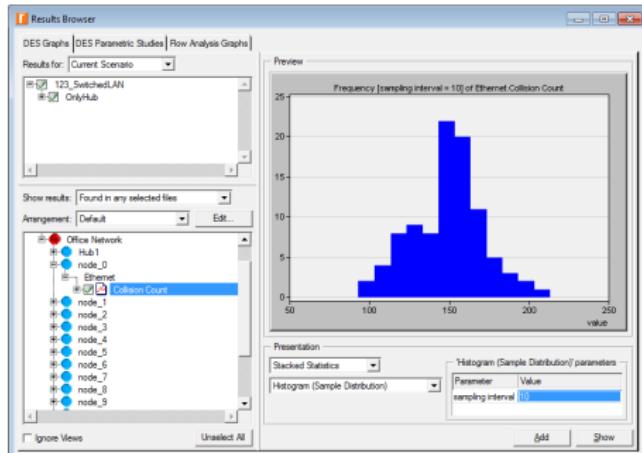

# Predefined Filters (cont'd)

- **Histogram (Time Distribution)** – uses the 'time spent' by the statistic within each interval as the measure of frequency
  - If sample interval = 0.0, then there will be 100 intervals
  - If sample interval = ..., then it sets the interval size

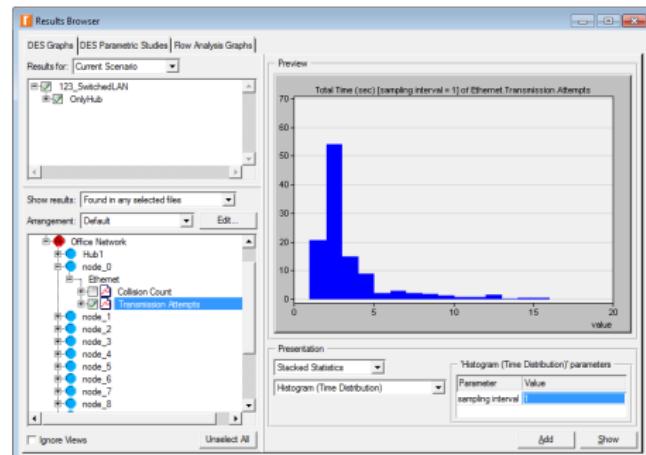

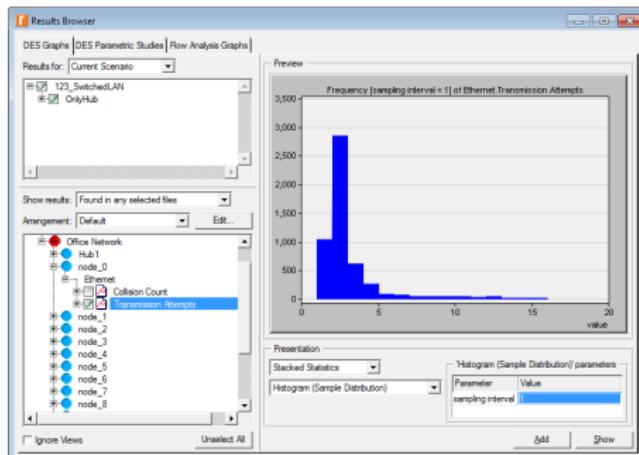

# Predefined Filters (cont'd)

- Bucket mode: **Sample Distribution** vs. **Time Distribution**
  - For input statistics that have regularly spaced entries in terms of abscissa values, the shapes of the two histograms are identical

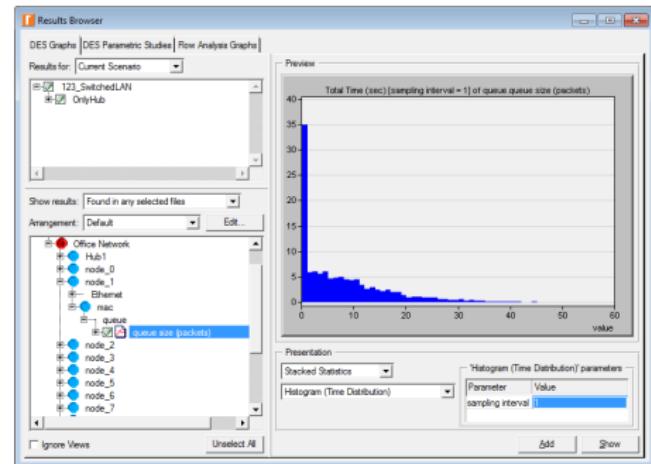

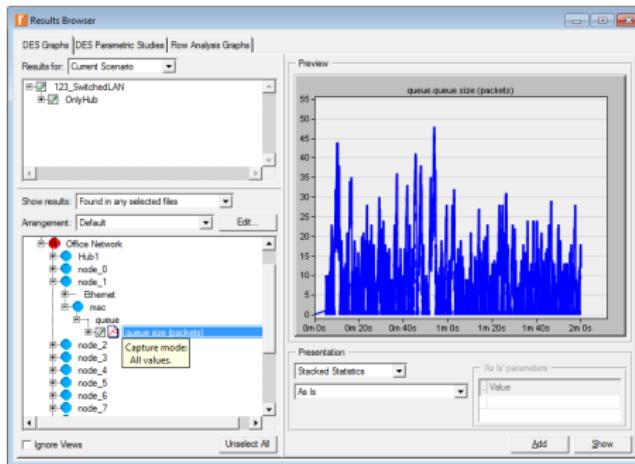

# Predefined Filters (cont'd)

- All values: **Sample Distribution** vs. **Time Distribution**
  - For input statistics where abscissa values of entries are not regularly spaced, results can vary significantly between the two methods

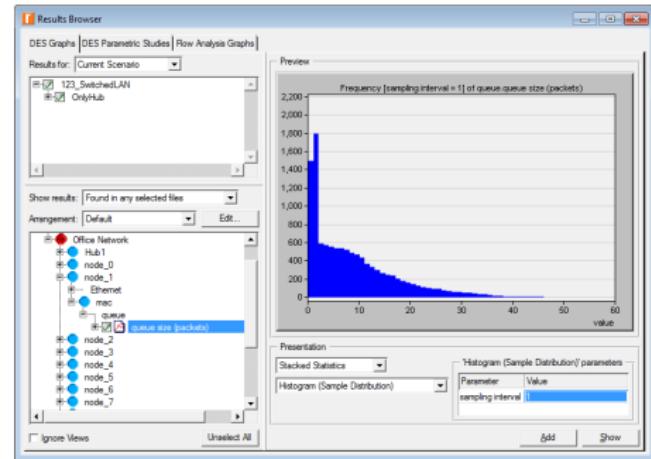

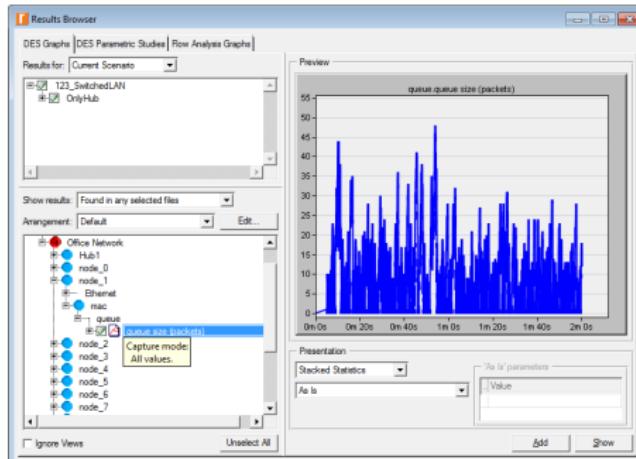

# Predefined Filters (cont'd)

- **Histogram (Time Distribution)** – most appropriate for statistics that measure a quantity representing **the state information**
  - E.g., queue size, channel utilization, date rate
  - In case of queue size, it represents the amount of time that the queue size actually holds a particular value

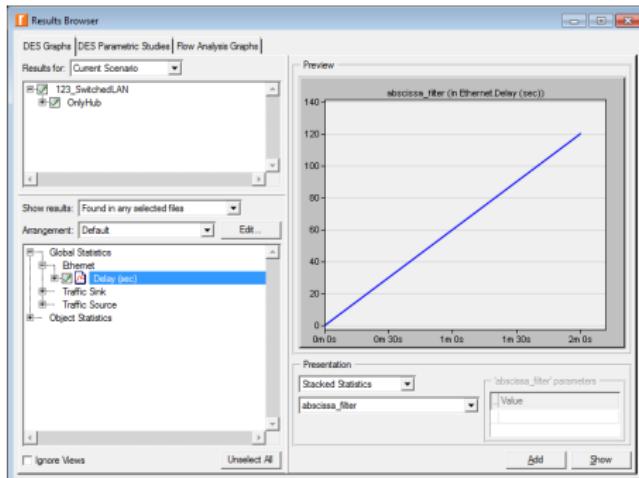

# Predefined Filters (cont'd)

- **Histogram (Sample Distribution)** – most appropriate for statistics that measure a quantity representing **the occurrence of events**
  - E.g., packet delay, error rate, transmission attempts
  - In case of queue size, it represents how many times the queue size changed to then arrive at a particular value
  - This provides no definite information about how often one might expect to find the queue at a particular size ☺

# Predefined Filters (cont'd)

- **abscissa\_filter** – displays the abscissa values of a selected statistic
  - $\text{abscissa\_filter}(i) = X_i$

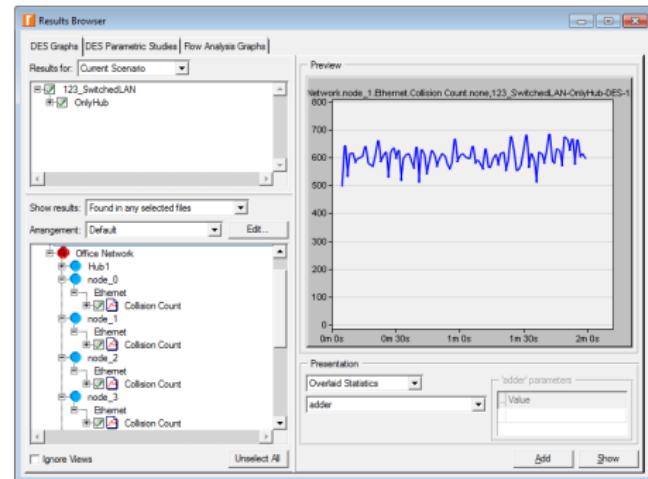

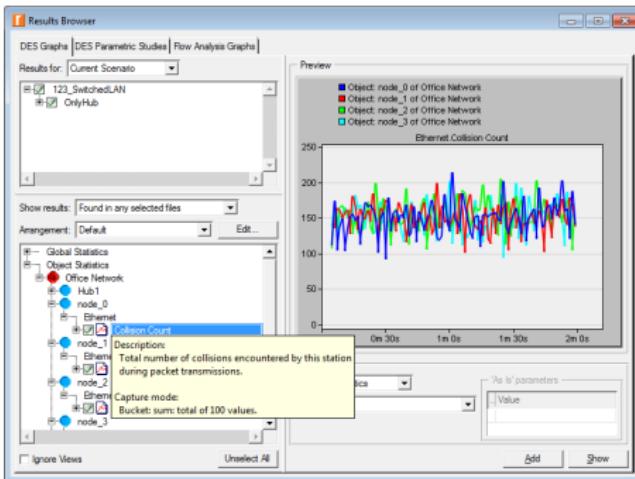

The screenshot shows a Microsoft Excel spreadsheet titled '123\_SwitchedLAN-OnlyHub-DES-1\_0.txt - Excel'. The table contains two columns: 'A' and 'B'. Column A represents time in seconds, and column B represents the value of the 'abscissa\_filter' for Ethernet Delay. The data is as follows:

|     | A     | B     |
|-----|-------|-------|
| 89  | 104.4 | 104.4 |
| 90  | 105.6 | 105.6 |
| 91  | 106.8 | 106.8 |
| 92  | 108   | 108   |
| 93  | 109.2 | 109.2 |
| 94  | 110.4 | 110.4 |
| 95  | 111.6 | 111.6 |
| 96  | 112.8 | 112.8 |
| 97  | 114   | 114   |
| 98  | 115.2 | 115.2 |
| 99  | 116.4 | 116.4 |
| 100 | 117.6 | 117.6 |
| 101 | 118.8 | 118.8 |
| 102 | 120   | 120   |
| 103 | 120   | #N/A  |

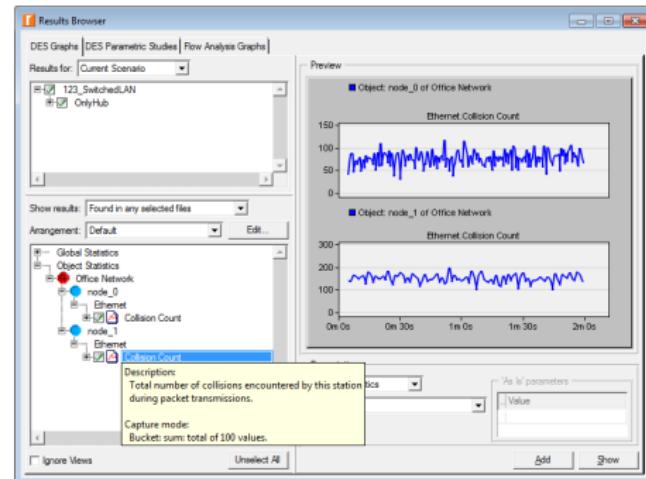

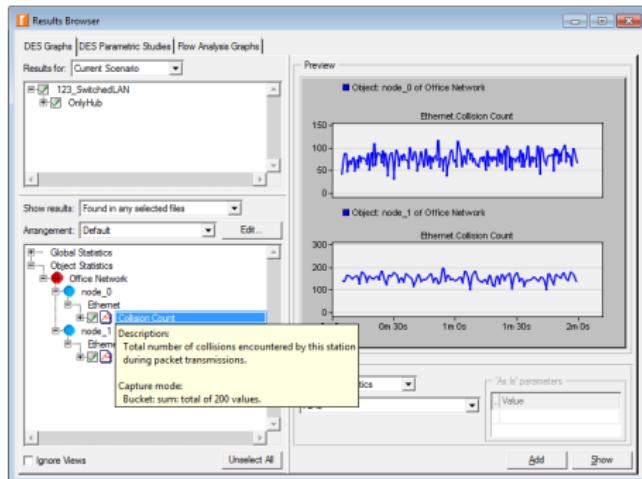

# Predefined Filters (cont'd)

- **adder** – displays a graph that contains the sum of values of one or more statistics
  - If the input statistics have exactly the same number of entries and these entries are aligned with respect to their abscissa values, then the output statistic can be computed simply by adding ordinate values for entries of equal abscissa

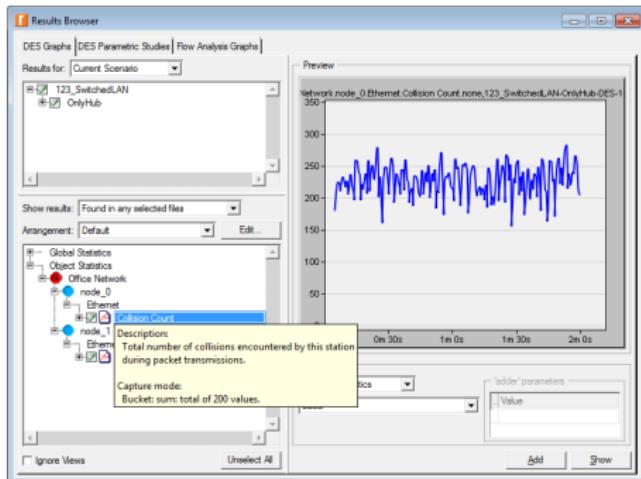

# Predefined Filters (cont'd)

- What if the input statistics are not perfectly aligned with respect to each other?

# Predefined Filters (cont'd)

- In such a case, an abscissa alignment mechanism is automatically applied by this filter before adding is performed

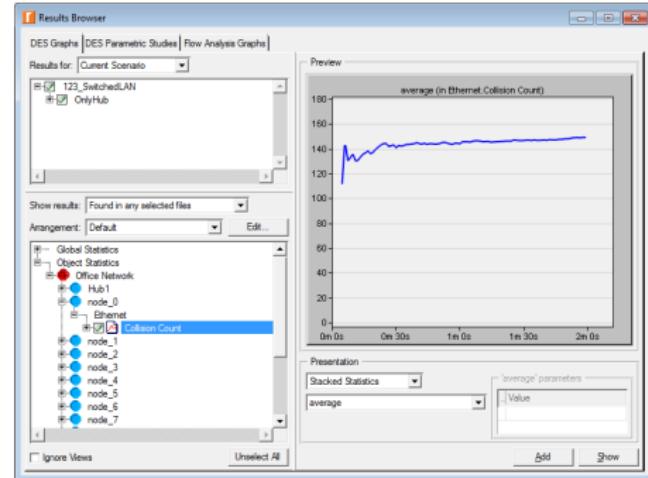

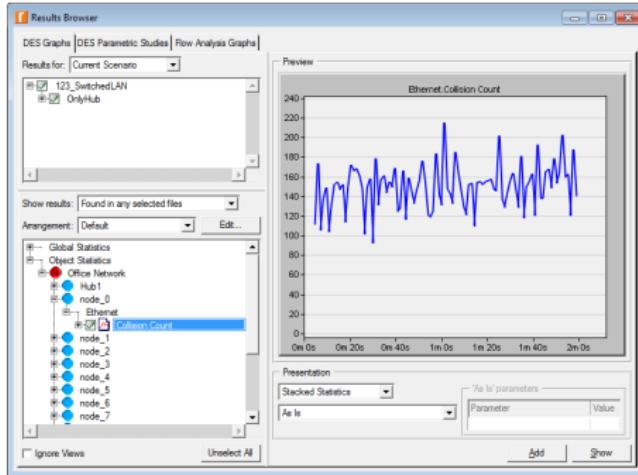

The screenshot shows an Excel spreadsheet titled '123\_SwitchedLAN-OnlyHub-DES-1\_6.txt - Excel'. The data is organized into columns A through J. Column A is labeled 'time (sec)'. The first 15 rows of data are as follows:

| A  | B          | C        | D        | E                                     | F                            | G | H | I | J |
|----|------------|----------|----------|---------------------------------------|------------------------------|---|---|---|---|
| 1  | time (sec) | 123_Swic | 123_Swic | 123_SwitchedLAN-OnlyHub-DES-1: Office | Network.node_0_Ethernet.Coll |   |   |   |   |
| 2  | 0          | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 3  | 0.6        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 4  | 1.2        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 5  | 1.8        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 6  | 2.4        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 7  | 3          | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 8  | 3.6        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 9  | 4.2        | #N/A     | #N/A     | #N/A                                  |                              |   |   |   |   |
| 10 | 4.8        | 42       | 139      | 181                                   |                              |   |   |   |   |
| 11 | 5.4        | 70       | #N/A     | 209                                   |                              |   |   |   |   |
| 12 | 6          | 87       | 137      | 224                                   |                              |   |   |   |   |
| 13 | 6.6        | 87       | #N/A     | 224                                   |                              |   |   |   |   |
| 14 | 7.2        | 47       | 164      | 211                                   |                              |   |   |   |   |
| 15 | 7.8        | 59       | #N/A     | 223                                   |                              |   |   |   |   |

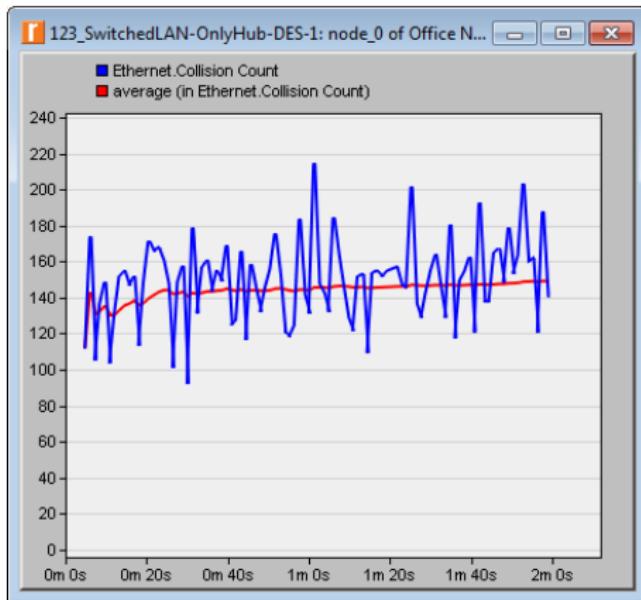

## Predefined Filters (cont'd)

- **average** – displays the simple moving average of the values for a selected statistic

## Predefined Filters (cont'd)

- $\text{average}(n) = \frac{\sum_{i=0}^{n-1} Y_i}{n+1}$

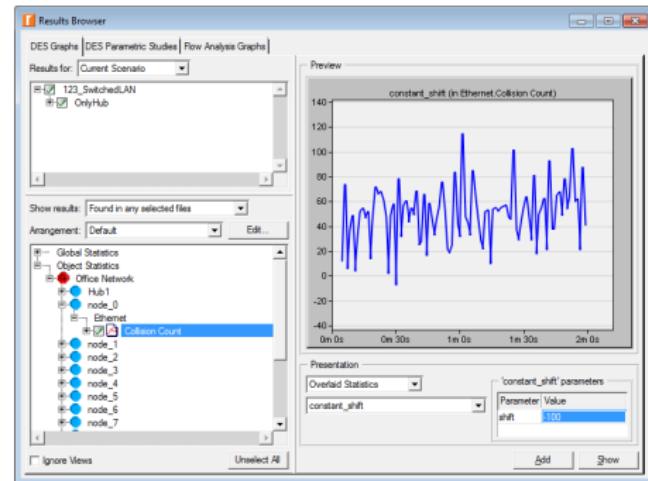

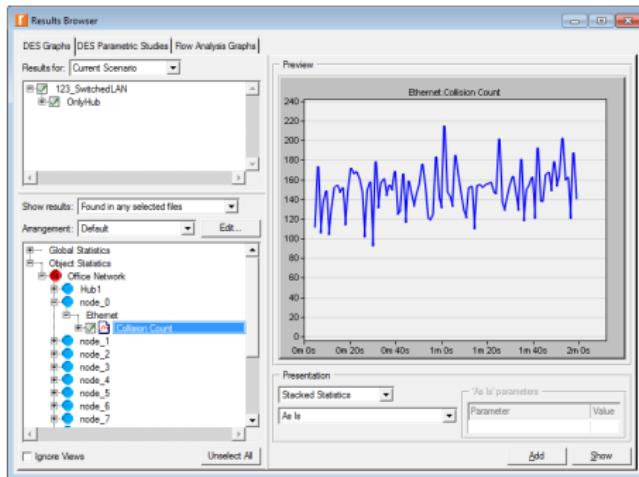

Screenshot of an Excel spreadsheet titled '123\_SwitchedLAN-OnlyHub-DES-1\_10.txt - Excel'. The table contains data for 'Ethernet.Collision Count' over time.

## Predefined Filters (cont'd)

- **glitch\_notch** – eliminates the occurrence of multiple entries that share the same abscissa value ('glitch')
  - If no glitches exist, then **glitch\_notch = As Is**

# Predefined Filters (cont'd)

- Otherwise, it eliminates entries to ensure uniqueness of entries at each abscissa value

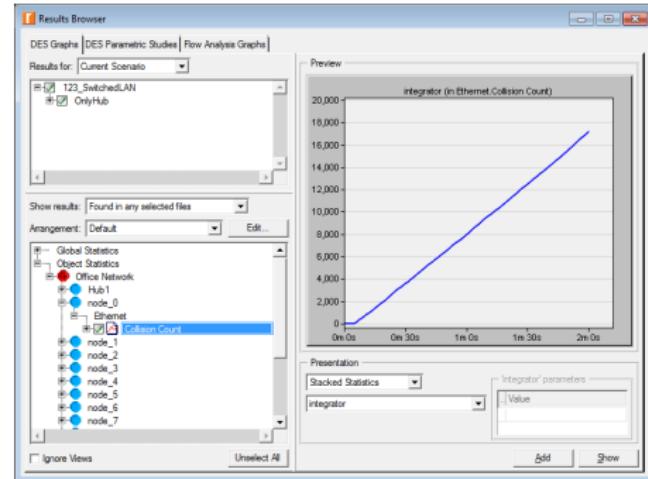

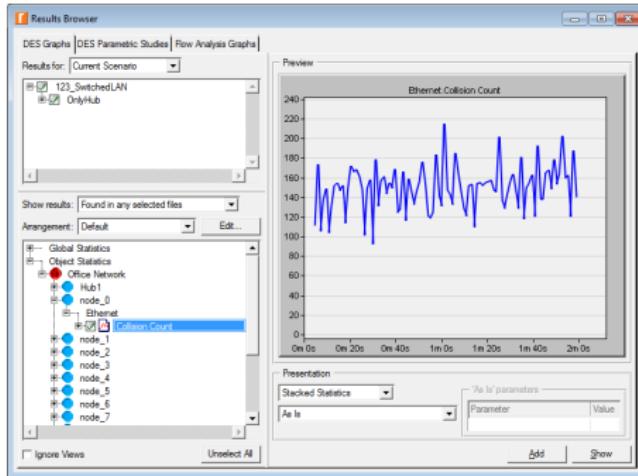

The screenshot shows an Excel spreadsheet titled "123\_SwitchedLAN-OnlyHub-DES-1\_15.txt - Excel". The data is presented in a table with columns A, B, C, D, E, F, G, H, I, and J. The first row contains column headers: "time (sec)", "123\_SwitchedLAN-OnlyHub-DES-1: Office Network.node\_1.mac.queue.size". The subsequent rows show data points, mostly consisting of zeros, with some non-zero values appearing at regular intervals. Row 5 has a value of 5.017495 in column B. Row 10 has a value of 5.036873 in column B. Row 15 has a value of 5.130149 in column B.

## Predefined Filters (cont'd)

- **moving\_average** – displays the continuous moving average of the ordinate values of a selected statistic over intervals of a specified width ('window')
  - If window  $\approx dx$ , then **moving\_average**  $\approx$  **As Is**

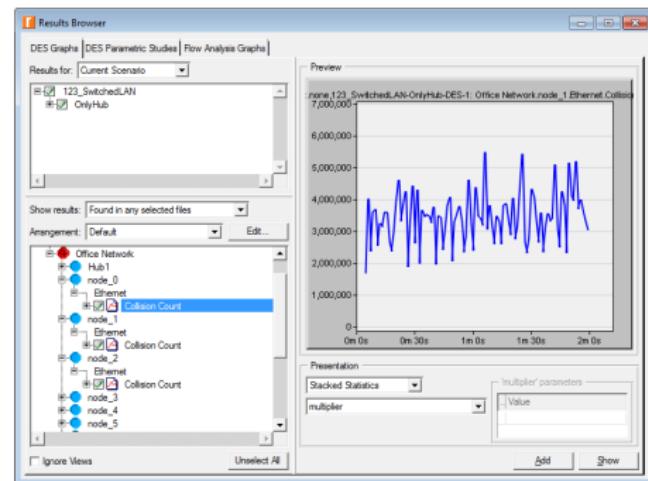

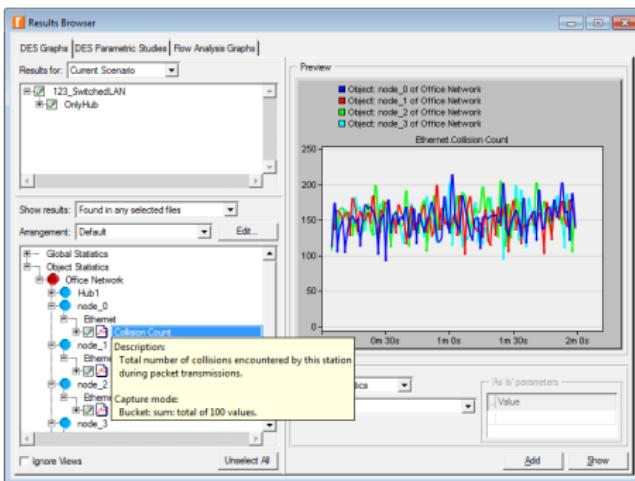

## Predefined Filters (cont'd)

- When the 'window' parameter is set to a large value relative to the typical abscissa spacing between entries of the input statistic, the 'moving\_average' filter provides a smooth result
  - E.g., **window = 10** vs. **window = 20**

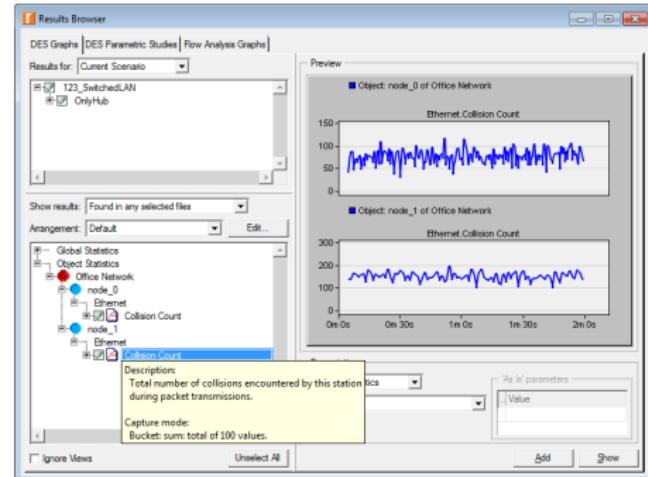

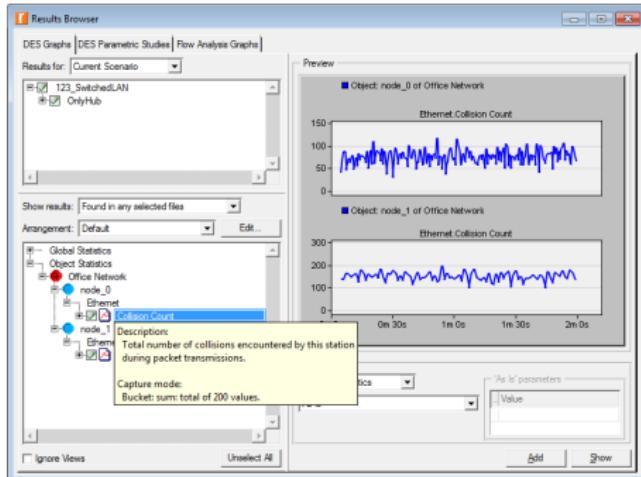

# Predefined Filters (cont'd)

- **multiplier** – displays a graph that contains the product of values of one or more statistics
  - If the input statistics have exactly the same number of entries and these entries are aligned with respect to their abscissa values, then the output statistic can be computed simply by multiplying ordinate values for entries of equal abscissa

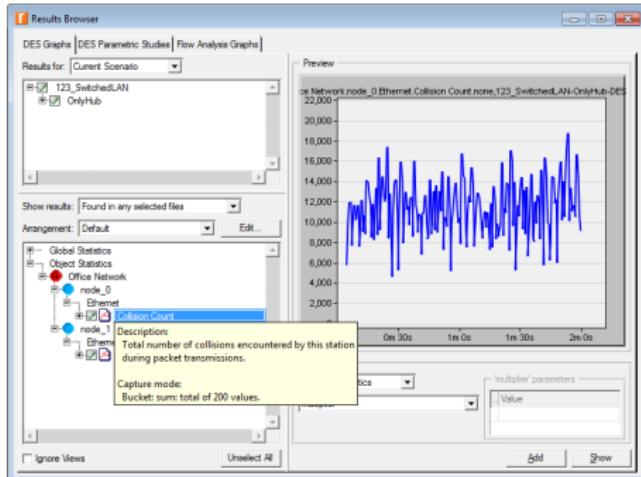

# Predefined Filters (cont'd)

- What if the input statistics are not perfectly aligned with respect to each other?

# Predefined Filters (cont'd)

- In such a case, an abscissa alignment mechanism is automatically applied by this filter before adding is performed

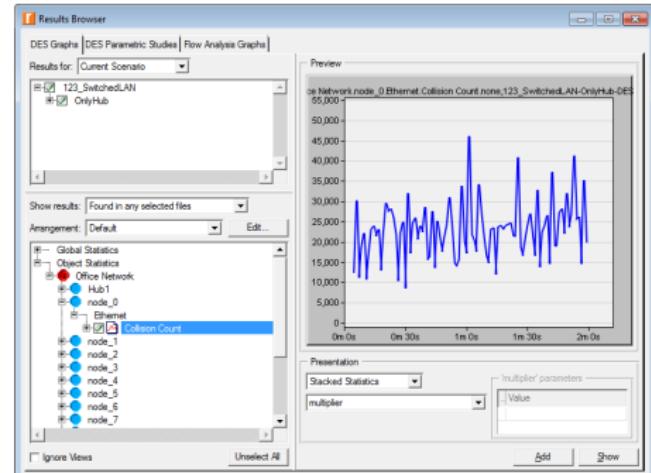

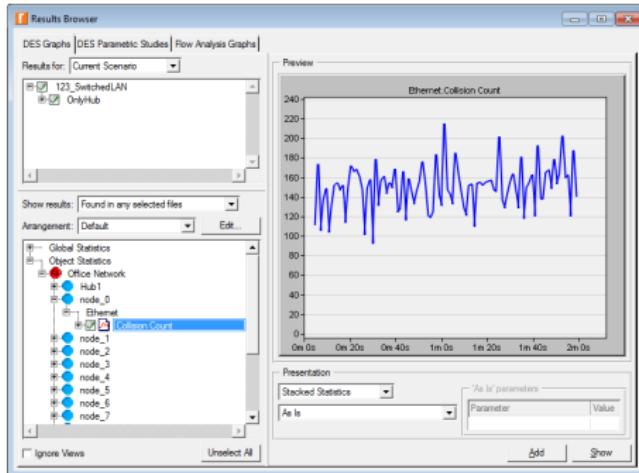

The screenshot shows an Excel spreadsheet titled '123\_SwitchedLAN-OnlyHub-DES-1\_B.txt - Excel'. The data is presented in a table with columns A through J. The first few rows show the header and some initial data points. The table continues with more data points, showing a pattern of collisions over time.

# Predefined Filters (cont'd)

- **time\_average** – displays the continuous moving average of the ordinate values of a selected statistic
  - The difference between 'time\_average' and 'average' is that entry values are not weighted equally, but are instead weighted by the difference between their own abscissa and that of the subsequent entry

## Predefined Filters (cont'd)

- $\text{time\_average}(n) = \frac{\sum_{i=0}^{n-1} Y_i \times (X_{i+1} - X_i)}{\sum_{i=0}^n (X_{i+1} - X_i)}$ 
  - In effect, each value is weighted by the amount of time that the input statistic had that value

## Predefined Filters (cont'd)

- If  $dx \neq \text{const}$ , then **time\_average**  $\neq$  **average**

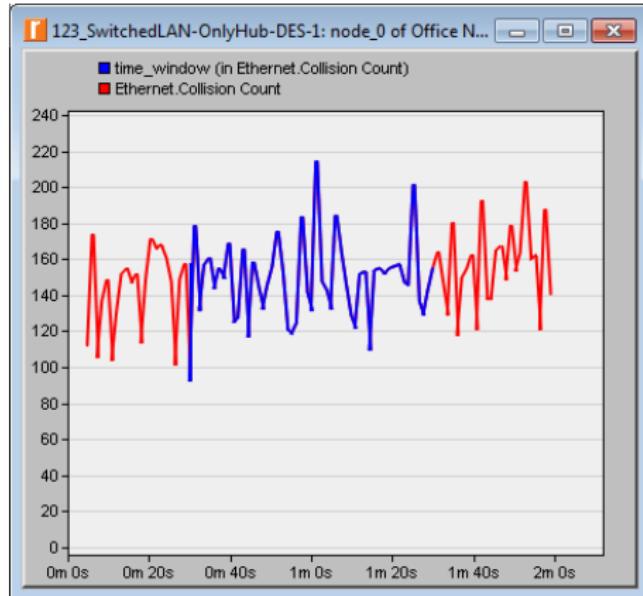

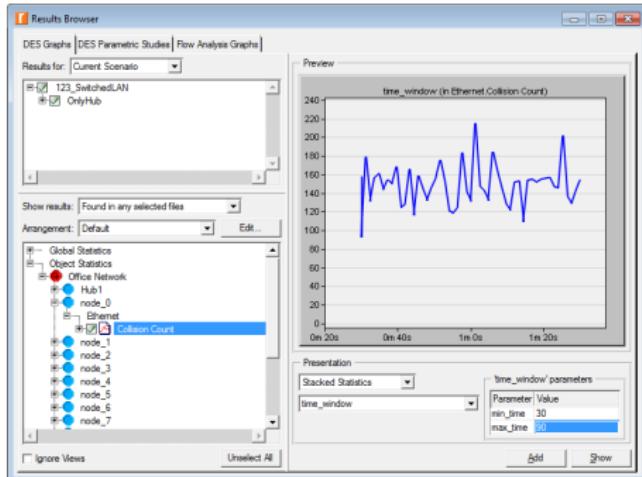

## Predefined Filters (cont'd)

- **time\_window** – eliminates all entries whose abscissa values lie outside a specified range
  - If  $[0.0, +\infty]$ , then **time\_window = As Is**

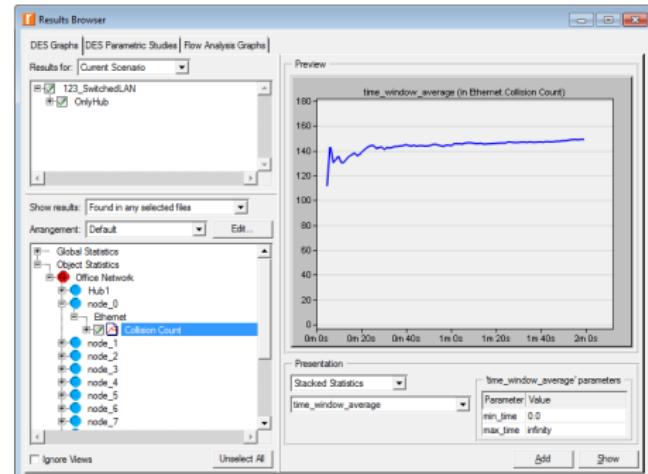

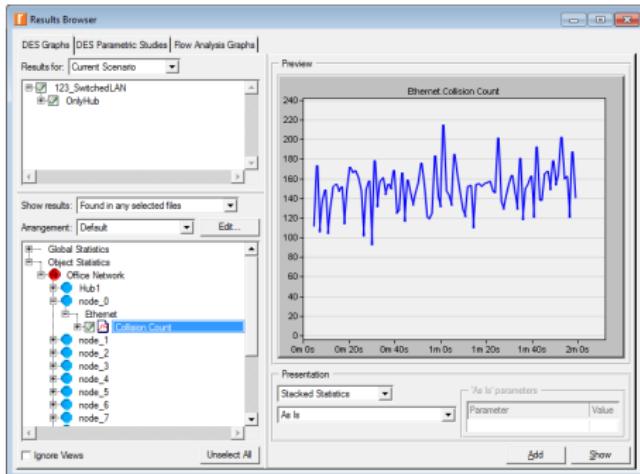

## Predefined Filters (cont'd)

- The 'time\_window' filter is equally applicable to any type of statistic, not only a time series

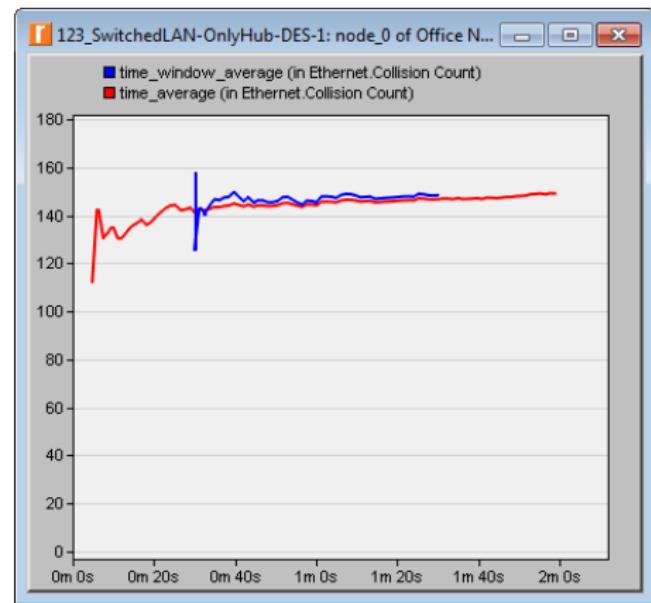

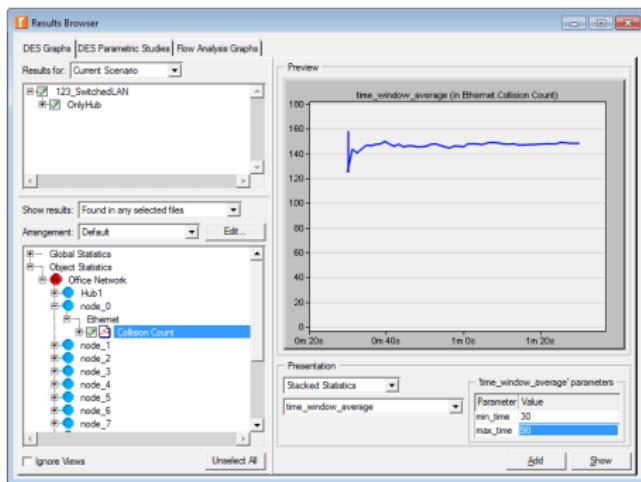

## Predefined Filters (cont'd)

- **time\_window\_average** – displays the running continuous average of the ordinate values of a selected statistic within a specified range
  - If  $[0.0, +\infty]$ , then **time\_window\_average = time\_average**

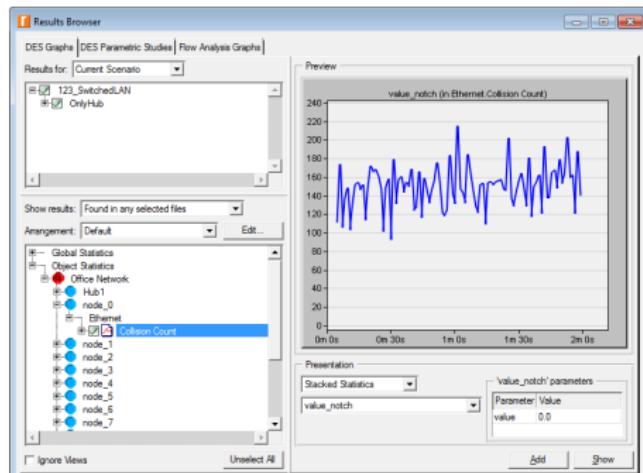

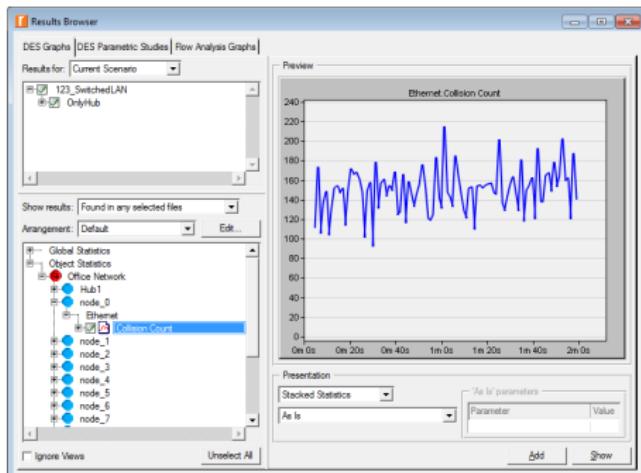

## Predefined Filters (cont'd)

- Otherwise,  $\text{time\_window\_average} \neq \text{time\_average}$

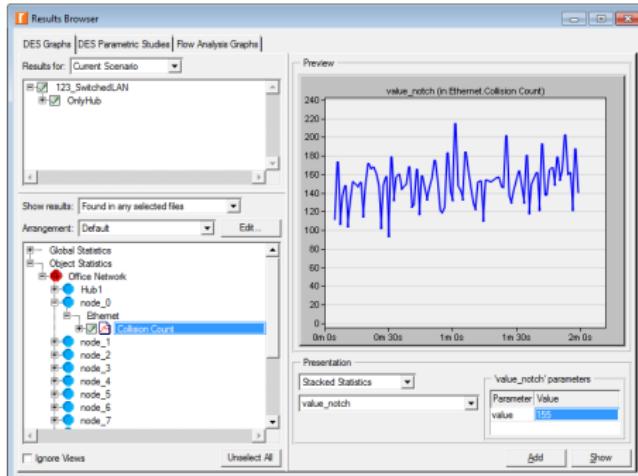

## Predefined Filters (cont'd)

- **value\_notch** – eliminates all entries that are equal to the specified value ('value')
  - If  $\text{value} = 0.0$ , then **value\_notch** = As Is

# Predefined Filters (cont'd)

- E.g., value = 155
  - Entries with this ordinate value are eliminated

The screenshot shows an Excel spreadsheet titled "123\_SwitchedLAN-OnlyHub-DES-1\_33.txt - Excel". The data is filtered to show only rows where the value of "value\_notch" is not 155. The columns are labeled A through J, and the data starts from row 2. The visible data is as follows:
